This is interesting. 2 years ago Geaorge Warner wouldn't
have admitted that the impedance can change even though
the SWR remains the same along a run of coax (assuming a
mismatched load).

I guess I'm not the only old dog who's learned a few new
tricks in the last couple of years. (Hi George :)

Yes. I WAS involved in a situation with Mr.. Bill Eitner. In fact if you were to look at his VERY last reply to me, he simply stated he was trying to start shit.

Is this the best argument you have? Is this how you rebut against what I have said? Do you not realize that someone only has to follow this whole thread and they will see where YOU jumped in with "incoherent" gibberish?

I believe I asked you to point out some proof that the HR-2510, HR-2600, and Lincoln are not HAM radios by nature/production... Well??????

You make me laugh... you know.... forget it... people can obviously see if they read the whole thread that you my friend are an idiot. Bye.

People often "shy away" from Radio Shack gear. So, for the record, Radio Shack DOES NOT make their own equipment. And neither does SEARS. But if Sears sold a "Craftsman" radio, you'd probably buy it !! Radio Shack radios are either made by UNIDEN or GENERAL RESEARCH ELECTRONICS (GRE) 'Nuff said...

>freebanders. That's the target market and that's where the sales are. Prove
me
>wrong. :)
>

Well, well Joe. I never made comment that the sales WERENT going to
"freebanders." Show me where I did?

Look. As far as this whole thread is concerned, Im about sick of it. Im
sure you have proved yourself to be an idiot that makes up arguement as you
go along. You do not stick with the topic. My rebuttal was to your comment
made to the orginial poster of this thread assuming he was a CBer trying to
modify a CB radio to go to the HAM frequencies (20 meters). When in fact,
he never presented himself as a HAM OR a CBer, and was inquiring how to
modify a HAM radio to operate on a different HAM band. Didnt you understand
that you simpleton?

><<<Yes. I WAS involved in a situation with Mr.. Bill Eitner. In fact if

>BTW?)

Picking a fight? No. I dont "pick" fights. I only find them. If I am not
mistaken you made the first derogatory ignorant statement within this
thread. If you doubt me, I can post the original post, then your original
smart ass ignorant assumption ass remark.

As far as the CB amp repair business. All I can say is, what the hell are
you talking about? So, you feel the tension of people seeing that you are a
complete ass, so you wish to start rumors now? You know my friend, you act
like you are in High School.. Didn't you ever mature? Gee. I kind of wish
we were in High School my friend. I would LOVE to kick you ass on the

playground. But, I guess I am already doing it through words... Take care..

Hank

PS - If anyone is lost by his post, it is because he decided to do a copy paste post to set it above all other threads, so that he can keep this ball rolling. I myself, am through with this idiot. Would anyone care to take over.

In the context of what the Bird 43 reads, it will not show a 50
percent increase in wattage. It's not that this 50% is not there, it's
just that the meter won't show it. This is exactly what Bill has
been discussing from his original post. If Jack, Russel, and
Timebomb would just pay closer attention and not be so
quick to shoot someone down then maybe this group would
stop sounding like a channel 19 power war.

Now you should study AGC circuits. Also remember
that I suggest desensitizing the receiver by
reducing the RF Gain and shorting the antenna's
center pin to ground.

Hi Joe

I think your talking about something like the Spectrum that has a
whole bunch of radials?

see the link

http://www.bills2way.com/equip/images/spectrum1600.jpg

Look for the same antenna on other sites to get a better picture.

There was one like this where I lived a long time ago. I was told by
an old timer that is was a conlinear. That was back in the late 70's.
I tried to get it but the woman who owned it would not let it go as it
belonged to her husband who had passed away.

1942. RADIo SHACK's NEW 10M mobile.....

Newsgroup: rec.radio.cb
Date: 1999-08-13 00:00:00 UTC
From: advanspec@aol.comburger
Message-ID: <19990813160139.27924.00000467@ng-cj1.aol.com>
Source record: 1950

Here's some interesting news.....
The new HTX-10 all-mode 10M mobile will appear in the new RS 2000 catalog due out in about 2 weeks. Features 25W output on SSB & FM, does AM too, split frequency and full freq control, full 10M, not stuck in "bands or channel steps" & has memory channels. The catalog price is $149.99 & the radio looks alot like last year's Radio Shack SSB CB (I think it was called the TRC-485??) and also like the similar "eagle" & road force "export" rigs. Knowing R/S, it is most likley not going to be easily modifiable to CB, but if it is the $149 price is going to give the '2950's and the new Delta Force Magnums that sell for well over $240 a kick in the pants. I'm not impressed with the Xmit audio & recieve on the similar looking rigs, but that price still has to be the lowest retail on an all-mode 10M radio w/full freq display (and between "employee discounts, Sales and franchise dealers, the price will go lower). This wasjust someinteresting news I came across.....we do not carry Radio Shack products.....

Rfwatts, (Shortened Version)

An am signal is composed of three parts: The carrier, an upper sideband and a lower sideband! The carrier is there to allow the detector circuit in the receiver on the other end to demodulate the sidebands, the components of the signal which contain your voice. When audio is superimposed on to the carrier, the sidebands are created. In sideband operation, one of the sidebands and the am carrier are filtered out, leaving the remaining sideband. The sideband receiver on the other end reinserts the missing carrier to properly demodulate the signal! Sidebands have everything to do with being able to retrieve the voice or intelligence being conveyed in an am signal!

better
> in the lay public's mind.

The lay public!! Kid wake up! The public doesnt give a rats ass about CBers. Its Hams who have the biggest concern about CB behavior. Stop listening to those nitwits on your local 2 meter repeater and get informed about whats happening in the real world.

The biggest reason why Hams have always been concerned with CBers is because the Lay Public has always confusing Hams with CBers because they dont know difference between the two.

This is what aggravates Hams the most.

While the impedance does change with coax length, the SWR does not.
They are all impedances of constant SWR.

Let me give you a simple example:

Consider a 25 ohm antenna.

At even multiples of 1/4 wavelength, the input impedance is
25 ohms. The SWR is 2:1.

At odd multiples of 1/4 wavelength, the input impedance is
100 ohms. The SWR is 2:1.

At every other length, the input impedance is some complex value.
In all cases, the SWR is 2:1.

Mike, I think you're missing something. Placing a meter at the
antenna does nothing to eliminate the ill effects of current on
the outside of the coax. So, if it isn't convenient, why bother?

> antenna impedance each 1/2 wave down the line from the antenna.

Again, we're not measuring impedance; we're measuring SWR. While impedance
is not constant along the line, it doesn't matter. SWR is constant all along
the line and that is what we are measuring.

Stop wasting your time fiddle-farting with coax length!

As long as the CBer's follow and work within the limits of Part 95 they will have little problem. However there is a lot more to the problem on 11 meters that just the use of illegal amplifiers. The text of the news paper article, I posted on 8/12/99, talks about cussing on the air. That is one of the things that had the local neighborhood pissed off about. Yes, the CBer's equipment mite have been legal, but the language coming out of his mouth sure isn't if you believe his neighbors.

>The problems of morons on the radio irritating the general user will
>always be there. But amateur radio has that problem too, albiet not
>as bad.

True. However again, there are many more CBer's out there than Ham Radio operators. It's the "morons" on the CB Band, due to the large number out there, causing most of the problems and the Ham Radio operator gets lumped in with them. So many Ham Radio operators get a bad name, because of illegal CB operators, because in the lay public's mind we are the same.

> This is only true if the antenna is matched. A 1/2 wave (electrical length) shows the antenna impedance at the feed point. So if you can't insert the meter at the antenna, a 1/2 is a good starting point to use to match the antenna with the meter inserted at the transmitter. After you match the antenna, then the length of coax shouldn't effect the SWR.
>

> Feed the same antenna with a 1/2 of 75 ohm (or 50 ohm) coax, the feed point impedance will be 36 ohms.

Your example is OK so far.

> The SWR is not the same all along the coax, unless the antenna is matched.

Not true. The SWR is constant all along this 75 ohm coax. If you use a 75 ohm SWR meter, you will find that it is so. Standing waves are the interaction of forward and reflected power. Since the forward and reflected power are constant along the coax (how could they be otherwise?), the SWR is constant.

You are incorrectly substituting "input impedance" and "SWR". They are not interchangable; you must be careful how you use these terms. The input impedance does change as the coax changes. At 1/4 wavelength, the input impedance is 50 ohms and will present a good match to a 50 ohm system. This is not equivalent to saying that there are no standing waves along the 75 ohm coax. If it weren't for the reflected power on the 75 ohm coax, you would not see 50 ohms at the input.

> So you can match an antenna by changing the length of coax.

Now you've changed the scenario. We were discussing changing the length of 50 ohm coax in a 50 ohm system. It will never improve your SWR.

It is possible to use some other impedance of coax to change the input impedance seen by your (presumably 50 ohm) system. When this is employed, however, it is generally done by employing specific lengths of coax to match specific target impedances of an antenna. You don't simply go cutting coax until your match gets better.

>I'm a CBer and talk on the ham bands anytime I feel like it.

The 11 meter band "used" to be a Ham Radio Band at one time. By your logic I would assume you would have no problem if is was again a really popular, but unofficial, Ham Radio band again? You show up on 10 meters, Ham's then feel free to drop down to 11 meters. You don't like it, then stay off the Ham Radio bands.

Just got a Wilson short load antenna with a W1000 mag-mount. I'm wondering if I need to drive into an open field or something to tune the antenna, or can I just park outside my apartment? Will surrounding buildings give me accurate SWR readings?

Thanks,
-Robert Chen

Cough up the green stamp if you want the card,a lot of DX stations don't need your card as US cards are easy to get.Some of these countries are very rare and send out a butload of cards.If your card,envelope(s),postage add up to $1 you need to shop around,I pay $64 for 2000 cards,about $.03 a piece.

George Warner wrote in message ...
>> >Why wouldn't that also be a problem when measuring SWR at the
>> >antenna end? What makes the reading at that end any better?

If you measure at the antenna feedpoint terminals, there IS no coax, therefore you cannot have " RF on the outside of the coax". What makes the reading at the antenna end "better" (your word, not mine) is when it is a more convenient place to reach, as when you are at the top of a tower.

>> >Just put the SWR meter at your radio. For most applications,
>> >it tells you everything you need to know (and it's very
>> >convenient, too).

For a lot of applications, reading SWR at the transmitter end is convenient, and if you are certain that you have no RF on the feedline, then I'll agree. It is not convenient for me when I am installing a new antenna at the top of a sizable tower. In that case, it makes more sense to do measuring and adjusting all in one climb!!!

>Mike, I think you're missing something. Placing a meter at the
>antenna does nothing to eliminate the ill effects of current on
>the outside of the coax. So, if it isn't convenient, why bother?
>
>George

Sorry, George, your arguement doesn't hold water. Again, if there is no coax, there is no current on the outside of it! I measure where it is convenient FOR ME. Inverted vees and dipoles are one thing, tower mounted yagis, delta loops, and such are a different animal.

My initial post on this thread was in regard to a guy with several problems that lead to RFI. Obviously, with an Antron 99, there is almost a certainty that he has an unbalanced antenna system, with the resultant current flow on the outside of the shield. Nowhere did I mention checking SWR at the antenna--- that was your question. If you need more help with antenna and/or transmission theory, may I suggest the ARRL antenna books. They are low cost and I have not yet found a single major mistake in them. Or if you prefer, try Rec.Radio.Amateur.Antennas.

More expensive speakers are probably better but not always LOUDER like you need,match the speaker to the audio output you'll be plugging it into.A 5' square Klipschorn is a great speaker but if you hook it up to a walkman you might not hear anything.

Sounds interesting but how reliable is your info? Radio shacks recent ham rigs,The two 2 meter mobiles and the two 2 meter handies and the dual band VHF/UHF handi have been overpriced.Also the mobiles suffer from intermod and desense so bad the first one (HTX212) was only made a few months before being discontinued.The newer HTX 242 is about the same but with some better features.The 202 was OK in it's day but lacks a lot of usable features like enough memories and extended TX/RX yet still suffers from interferance.My favorite RS foible was the dual band handi,discontinued after only ONE month.Even if the shack made a good rig many would be embarrassed to own something with that label.Also the last RS 10 meter the HTX100 was easily modifiabl,as are many of thier scanners and CBs.

Source record: 1996

You did the right thing. Your radio and amp will be more reliable.
Your system will also sound louder and more impressive. You don't
have to believe me. Obtain a second, cheap CB and use it as a
monitor receiver so that you can listen to yourself while you
do your tuning. There is no better, single piece of test equipment
available than a second CB set up as a monitor. Connect a pair
of good quality (that means efficient with flat response over
the mid-range) headphones to the monitor using the external speaker
jack and a mono-to-stereo adapter. If the monitor has an RF Gain
control, turn it down all the way. Short the center of the monitor's
antenna jack to ground to make its receiver less sensitive.

When you get the monitor set up, then you can use it to see how
high you can set the radio's dead-key before the amp starts to
sound overdriven on its highest output setting. You'll find
that you can probably go to about 2 watts before the audio
quality starts to deteriorate noticeably. That'll very likely
be where the amp's output won't swing either way when you modulate.

Have fun.

You are truly ignorant aren't you? Where is the rest of my message? Where do I defend illegal CB? Where do I state I condone illegal CB? See, what you didn't understand, due to your lack of comprehension skills, is that I even said, clear as day, the HR-2510, HR-2600, and Lincoln are HAM radios! So how would the modification that the original author of this thread was requesting (e.g. converting a 10 meter radio to 20 meter and/or addition of 20 meter) be illegal CB activity?

Can you say jackass! You are such an idiot.. but keep posting smart ass, Im laughing my ass off of your ignorance.

The amp isn't a piece of shit, it's just designed to run at the
top of it's amplification curve so that you get the most out of
it. If you want it to be perfectly clean and trully linear, simply
swamp the input and increase the feedback. The downside is that
the output will drop to the transistor spec-sheet ratings. Most
mass-produced CB amps put out half again more that the transistor
spec-sheet ratings. You never get something for nothing. The
price you pay is that the positive modulation peaks are compressed.
If you don't compensate for that by lowering the dead-key drive,
the amp will backswing on an average-reading meter (like the amp
meter on a power supply). This stuff isn't rocket science or brain
surgury--you just have to understand the compromises that are
involved.

>>Hmm, if the FCC says his equipment is legal, which the article states, then he has nothing to worry about. The neighbors consumer electronic products must accept any interference that comes their way.<<

>Agreed, Consumer products just dont have sheilding to protect for outside signals, from radios or anything! Tony KC8EWU<

I agree, but ask any citizen what that Part 15 caveat is on their prized stereo or electronic device, and they have NO idea.

It's these people who have NO idea what the limits are on interference from legitimate sources, regardless of service or source, that show up at local zoning meetings and town hall assemblies decrying that "damned CBer" or that "damend Ham" that's tearing up their reception.

No one ever reads those warnings, nor do they have any idea what they mean if they do. Very few Hams OR CBers themselves have a really good idea what Part 15 is, what it regulates, or what it allows.

Educating the public should be a priority of any CB, Ham or scanner club. It is our mutual best interests to do so.

Hi all,

A couple years ago i remember one of my buddies were talking about a little handheld amplifier that would work for a handheld cb (duh). He said a friend of his had made one or bought one (i don't know which), but that it was abou the size of a cigarette pack and worked on a battery, and kicked out something between 5-50 watts. (not sure of which)

I believe he said it was called something to the effect of a cricket.

My question to you is this:
Has anyone else heard of something like this? a small amplifier that you connect to your handheld (or mobile) and would give out about 5-50 watts? I was reading soem past posts and saw some one talk about small amplifiers and it reminded me of this.

If you know anythin at all about anything like this please let me know... i'd greatly appreciate it.. thanks..

Something that small which could take 5 in and put 20-30 out is achievable, but the power source is another matter. If you had a motorcycle battery strapped to your waist, you could operate for several minutes assuming a 50 percent duty cycle. Beyond that, the battery would not handle the drain. The point is moot though since amplifiers on the CB band are illegal and you should already know that.

Source record: 2012

A few weeks ago at a garage sale I came across a Cobra GTL-150 missing a knob and the face plate peeling off. A quick sale at $5.00!!! I mainly thought I was buying an SSB cb radio for the motorhome. After getting around to checking it out, it has FM mode in addition to the normal SSB/AM. Also the faceplate has a "high, medium, low" frequency switch! This switch looks factory and so does the faceplate labeling. Changing the switch of course changes the range of the radio.

Is this an "export" radio of some sort? A search of different search engines didn't bring up anything.

You do frequency expansion mods on CB's all day, yet you don't condone illegal CB? Jeff. Please. Get real.

As for your vitriolic attacks, I can only imagine you feel that I'm somehow threatening your little business. I'm not.

I just think it's a shame that many manufacturers are now openly (by making 10 meter radios that easily mod to 11 and dumping "export radios in the US market) exacerbating the freeband problem. And that's really the issue at hand here. Not whether a re-badged Uniden product is marketed as a "ham" rig or as a CB rig.

Try using some ferrite cores on the wires going into the modem. That is probably where the RF is being picked up.

Radio shack has some clip on cores that are meant for power cords. Wrap a few turns of the wire around the core before you close it. Place the cores as close as possible to the modem.

From my understanding the FCC rules are technically called "Administrative Law". The congress passes a law that grants the FCC the power to regulate the radio spectrum and the FCC gets to fill in the details anyway it likes. This concept has been tested time and again in the courts and each time the courts were very clear, it is a "law".

Of couse you supply an FCC RF safety sheet showing the maximum allowed RF exposure I assume? If you don't then there will be a few less dumb CBer's out there because the ones stupid enough to run 30 watts next to their head (or other body parts) will be cooking their brains or getting cancer and die. That's why the Ham 2 meter HT's are limited to 7 watts or less. Also what about those reports about heavy cell phone users getting brain cancer too?

2043. MODIFICATION AND AMP BUSINESS

Newsgroup: rec.radio.cb
Date: 1999-08-14 00:00:00 UTC
From: Hank Aaron <jeffherrings@hotmail.com>
Message-ID: <7p361f$1smq$1@news.gate.net>
Source record: 2043

Hello all.

Well, as some of you might know... RHOOLIGAN2 has announced that I am doing channel modifications on CB radios and building/repairing linears.

Just be sure to email me for specifics.

Also, I do the illegal act of installing Connex boards, so please dont hesitate to get a hold of me.

Just thought I would be an ass... Just to see if some can take a joke.... Lets see..

Take care all.

Hank

>
Good point,Bill. On most of my inverted vee antennas, if I keep the physical lengths of the sides equal, the antenna is electrically unbalanced, and I wind up with phone and tv interference. By trimming one leg (which one was determined empirically!)
I am able to obtain electrical balance and have no current flowing on the outside of the coax. The results are: no more tvi, no phone interference, no vcr interference,ect.
Of course I can install a balun at the antenna end, or use a choke coil, but I was trying to understand ground conductivity in the front yard vs. the different conductivity in the back yard when I figured out how much and where to trim!!!

But why do you consider "FREEBANDING" as a problem if they stay below 27.995 MHz there are no probem to you only to the FCC (Or whatever they are calle din differnt countries). Let people do what they want as long they are not disturbing you on "your" QRG's if you want not to hear them simply turn your VFO away from 26.000-27.995 and problem is gone!!

>What you wrote is true, however nothing is absolute. For example look at Part 97.121 (Restricted Operation).<

$97.121 is written to provide relief where no other administrative or mutually agreeable course of action is attainable from relief from unacceptable interference.

Unacceptable interference does NOT include interference to devices manufactured under Part 15 to which prudent and reasonable filtering has been applied or substitution of the device has been offered.

I was privvy to a case in Atlanta several years ago where a citizen was getting RFI from several RF sources, including a friend's Amatuer station. The party harrassed my friend over it and even attempted to seek civil relief from it.

My friend had offered to place at his own expense, (even though he was not the only source of interference to this person's stereo) RF filters, and even offered to out-and-out replace the stereo, but the complaintant refused.

The courts stated that he (my friend) had made more than reasonable offers to solve a problem that was NOT his fault, and that the Part 15 devices were at fault, not the Amateur (or any other) emmitters. This was partly due to my friend providing a wealth of information to his own lawyer on the vagraties of Part 15 devices and the caveat that is printed on every device which may be prone to RF sensitivity.

The burden of proof should be upon the complaintant, not the licensee (or permitee in the case of Part 95 emmitters) to prove that unreasonable interference has occured. Unfortunately what usually happens is that the courts usually make the source of the RF prove that they are not at fault. This is clearly a violation of the concept of "innocent until proven guilty", since they are forced to prove themselves innocent, rather than the complaintant proving that they are at fault.

No one in the United States that is even remotely familiar with civil relief will admit that the law is 100% "just", but being prepared with knowledge of what YOUR obligations under the law are and what the laws pertaining to Part 15 are will go a long way towards protecting your rights as a radio operator under the law.

No one else will protect ANY of us.

I missed nothing. This News article, like so many other things is just one persons opinion. Do you know how many times Ive been quoted by a major local newspaper reporter in my area over the last 10 or so years? About 9. Do you know how many times they actually printed the correct verbatim information I gave them?
The answer is "zero".

These news-guys start calling every Friday afternoon for something to fill the Sunday paper with and because they are usually on a deadline, little time goes into the verification of facts. The Boston Globe and The Providence Journal Bulletin each have at least 3 "Full Time" lawyers on their payroll because of this "dis-information".

Don't believe everything you read in the papers.

2061. HF rig FS or trade

Newsgroup: rec.radio.cb
Date: 1999-09-07 00:00:00 UTC
From: Oris <oris@dirtball.com>
Message-ID: <37D5CC81.74F3601B@dirtball.com>
Source record: 2061

I have a ICOM 740 HF moblie that I would like to sale or trade. I'll take 300.00 cash plus shipping thats about 25.00 give or take. I trade it for a Pentium 233 socket 7(I will considerany other intell pentium computers above 120 Mhz) with at least 2 gig hard drive and 32 megs of ram, 56K V.90 modem,(Iwill consider 33.6 and 1 gig harddrive) Keyboard mouse and 13in svga monitor. Or I will take a 2-meter all mode base rig digital readout. Tell me what you have to offer for this HF rig.
The ICOM 740 is the stock IC-740 it has no power supply it runs strickly 12 volts DC. The rig is in good clean shape and I don't smoke and the guy that had it before me doesn't smoke. I was the third owner. I ran the rig in the moblie. The rig covers all the ham bands. It doesn't have a continous coverage receiver.The rig has both sidebands CW and RTTY as far as modes. Its demensions are 111mm (H) x 286mm (W) x 374mm (D). Its rated at 200 watts input. I will include stock mic and instruction manual.
Drope me a line and make offer
73 from Oris

2062. KCBRN

Newsgroup: rec.radio.cb
Date: 1999-09-07 00:00:00 UTC
From: CBKING <cbking@worldnet.att.net>
Message-ID: <7r4ii6$i0a$1@bgtnsc01.worldnet.att.net>
Source record: 2062

KCBRN (King Cyber Band Radio Network)

In January 2000 (1/2/00) KCBRN will be 10-8 on Ch 20 (27.205Mhz) regardless of any Margery. To each their own! Like someone said on here "be yourself" I hear that a lot so I guess this is a hint so thanks & I guess I may want things the way they were in the 60's, 70,s & early 80's & if someone lilkes my idea then OK, & if not then it is their lost. So this is CB KING = KBDA-7796 10-7 off this lilst. (I don't think that person who wanted to join my club was for real anyway)

2063. General Lee antenna

Newsgroup: rec.radio.cb

The reason I am doing this is [KCBN] club is for myself. I had thought that CB RADIO would be better on the air, but I am just letting things fool me because it will not get better for me. See I am just exited now because here in 1988 CB RADIO was bad & in the 1990's the use of CB RADIOS got good by the Internet! rec.radio.cb. People communicating by computer over phone lines. This way it is free of the music playing, cussing types. So therefore I am changing the name to KCBN (King Cyber Band Network), Also there are other reasons as well. Like (look @ following posts)

I want a radio that can talk on the freeband (regularly) and slide up on the 10 meter freq's, and I want as much watts I can put out of a big box that is driven into saturation with awesome quantities of harmonics that can bleed up and down the HF, UHF, VHF, SHF bands and beyond.

I want every CBer to do so also to just plain ol' mess with every tree-hugging "... oh you violated Part 95 of the FCC regulations" numbnutts to a point of INSANITY and keep on messing with them until they give pup the hobbie. Then we can calm down to 10kw and talk Am skip without harrasement.

Boy that'll be the day... but it'll be fucking great!!!

Great idea, since I use nonmetallic, nylon parachute cord as guy
lines. 500 lb test and while it is susceptable to UV effects, will still last
long enough to make it worthwhile.

Get a Texas Star. Run standard voltage to it. Use heavy power cables
and good coax. Don't use a magnet mount and don't drive it too hard.

Higher voltages burn up transistors and cause harmonics.

I'm sure that if he's using metallic wire for the guy lines, the
downward slope of the guy wires will also lower the take-off angle of his
signal, thereby increasing the range of his ground wave...

2101. Local Radio Operator Questioned by Police

Newsgroup: rec.radio.cb
Date: 1999-09-10 00:00:00 UTC
From: Wildcat <wildcat@tp.net>
Message-ID: <c4jC3.471$223.21666@typ12.nn.bcandid.com>
Source record: 2101

The RI State police visited a radio operator at his home yesterday at the behest of Cox Communications, a local cable provider. Cox Cable received interference complaints from a neighbor of the radio operator who was aggravated with the constant television interference he was receiving over his very expensive TV.

The RI State Police, taking Cox Cables word that they had the right to investigate said interference, took it upon themselves to approach the radio operator at his home in an attempt to correct the interference problem. It turns out that the radio operator was a licensed Ham. This individual willingly allowed the police into his home in addition to letting them document the equipment present at his station.

Upon hearing this story yesterday I did some research on the subject and found that The RI State Police does NOT have the jurisdiction to investigate any electronic interference complaints (unless said interference is during a declared Civil Emergency or Marshall Law has been enacted).

In addition, the radio operators civil rights were indeed violated when this illegal search this took place (Whether he volunteered or not).

This is a prime example of the law enforcement community automatically aligning themselves with a corporate entity, if the corporate entity is large enough. And, the police blindly discarding ones individual rights by taking the word of a large company without even researching the facts.

Because this person was/is a Ham, it is the responsibility of the television owner to rid himself of the interference problem, or the cable company must correct the interference from entering their cable lines, or the FCC must investigate to insure that the radio operator is running a legal station. These are the only 3 legal remedies to this scenario however Cox Cable Corp. assumed it could take the "bully" approach.

>not type accepted, it not really illegal until you actually use it.

a transmitter must transmit befor it is a station
a person with a s/w recever is not a station operater
it must be type accepted to be a cb station
(ie) it must be type accepted to transmit on cb frequency
if it transmits on cb frequencys it is a cb station
if it transmits on ham frequencys it is a amateur station
if a scaner receves both it is nether becus it hasnot and cannot transmit
a transmitter that hasnot transmitted is not a station
a ham must be licensed to operate a amateur station
(ie) he must have a license transmit on amateur frequencys
you do not nead a license to have a amateur transmitter
you just cannot operat it as a station (ie) transmit
it is not hard to prove you transmitted
(ie)you on a cb frequency in a moble with no other transmitters
conected on in the car but a modified cb, amateur transmitter or
other non type accepted transmitter as of part 95 rules

This is true. The Ham is the control operator of a federally licensed radio
staion, and as such, the FCC is the only entity that can take action
(including an inspection). In most cases, the FCC will tell the offended
party to "fix" their television. This is not to say that you shouldn't be
polite to the nice police officers while you are telling them that they
can't come into your home. (offering them a doughnut as you tell them to
go away would be a kind gesture) :-)

That was the Radio Shack 1/2 wave antenna.

I had one brand new, in the box, for my first antenna.

Grandpa bought it brand new, and never used it. Had it in storage for nearly 15 years!

Good antenna, but only handled about a kilowatt PEP.

>do you lose type acceptance. That doesn't mean that its illegal to
>posses, just illegal to transmit with. This is different than a
>manufacturer that has to meet type acceptance to be able to sell the
>radio.

>Not just being able to transmit is not illegal, actually transmitting
>is (by what part 95 actually says)

Stop ignoring Part 95.425 (a) . You have eluded (purposely?)
what this section says in all of your posts. Until you can explain
how your contention along with the clear statement that 95.425 (a)
says, then there is no point in arguing. It's not because this can't
be resolved. It's because you refuse to look at the clear evidence
that would destroy your argument.

****
95.425 (a)
You must not make, or have any one else make any internal
modification to your CB transmitter.
****
This is a stand alone statement that is not tied to any other
part of Part 95 through the use of words like "and" or "or"
It does not distinguish between the radio being in the transmit
or receive mode. It only talks of modding a transmitter. It doesn't
matter if this transmitter is in use or not. It does not specify it.

And owning a radio that is not type accepted in the United States (for use
on a band where type acceptance is necessary), is illegal.

Otherwise, Galaxy and the rest would be able to sell their radios.

Do you honestly believe that a radio that is not type accepted for CB use is
legal anyway? Or one that has lost type acceptance?

> But they were actually selling a product that had to meet type
> acceptance to sell the equipment.

No, they where not. I have two Digi-scans, one Redco RDS-1 and , and one
UFO. They are both in the box, and I pulled out the information on them.
Neither one is type accepted. After all, all they are is binary adders!

However, they where legal devices because they had instructions in the
manual to disable the transmitter, because a transmitter CAPABLE OF
TRANSMITTING on non type accepted frequencies is illegal.

Redco manual for the UFO, page 6, step 10:

"Cut the jumper wire (See figure 2, labeled #47), located behind the channel
selector to comply with FCC regulations."

Page 8, Step 7, (preceeding)

Note: Steps 7 and 8 must be performed to comply with FCC regulations

(Steps 7 and 8 explain how to disable the transmitter)

I am done with this thread. It is going nowhere, and just wasting bandwith.

I have owned a CB shop, been busted, and made it my business to know the FCC
rules afterwards. You can go on believing what you want, but I know what
the real truth is, having to live with the assholes from the Lemon Grove
(San Diego, Ca.) field office breathing down my back.

Have a good one.

Hello Bill: You would be better off with a Penetrator 500 a 5/8 wavelength antenna.
A hole lot less neighbor interference problems, and it gets out better.

Jay in the Mojave.

I would say that if you have a counter that read a 49 mhz phone from a room away, you have a real winner. By " room away " do you mean the phone on one side of the wall, the counter on the other? Or, the phone and counter on opposite sides of the same room? Rubber duck no gain antenna? I have tried several types of frequency counters, including Optoelectronics, and none of them would read a 49 mhz phone from more than a foot or two away max. I have not had the chance to try out an HP freq counter. What do those run these days??

Cheaper than their DC thru 325 ghz $ 80, 000 spectrem analizer i presume. Thanks for the information.

I think the ground radial length is based on the wavelength of the vertical antenna. If your using a 5/8 wave antenna, and the larger Firestik is also a 5/8 wave, then the ground radials should still work the same.

Better yet, since this is Australia, you should drive left unless you
are speeding. We have an unwritten law that law abiding drivers stick
to the left lane leaving the right lane clear for people who want to
speed. The absence of police encourages that sort of behaviour.

I hear stateside qsos on 10m all the time. Had one kid on 28.350
that kept saying Hellllllllllooooooo over and over and over again.
Then the old man got on and called someone, then the kid came back on
and started in again. I hear stateside stuff down in the CW portion
all the time as well. Can't play in their own yard I guess.

The FCC and TLC are now busting them left and right. With nice fines
too. The TLC agreed to help.

>We had to pull over and use a nasty, greazy pay phone.

Man, is that the truth! And at $0.35 to $0.50 each, these days!

I remember the day I went to cellular. I'd been off the road for a few years, working as the Customer Service Manager for a large cosmetic company. Desk job--phones at my elbow. Then the company relocated to another city, and I didn't want to leave. I took a severance package and used it to get into business for myself. The year was 1986.

One day, I was late for a meeting across town. What's worse, it poured rain, which slowed traffic even worse than normal. So what do you do? Pull over and call ahead from a pay phone (and make yourself even more late)? Or forge ahead and explain it when you get there?

I chose to pull up to a parking lot which had a pay phone. Got drenched running to it, only to find that it had been vandalized.

When the meeting was over, I stopped at a cell phone shop and said, "Can you put a phone in this vehicle....TODAY?

I have not been without one since. In fact, I carry two in my car--and one of them has that original number from 1986. My account is so old that the monthly bill is $9. But it gives me redundancy. Each phone is on a different carrier.

Originally, the phones were hard-wired. Today, I use the Motorola Ultra Classic (Brick) portables which will talk from anywhere!. My wife has a smaller Profile 300. And my adult sons use small portables, also.

By the way, there are several newsgroups dedicated to cellular phones, for those thinking of taking the plunge. For results, and which models to avoid because of problems, do a search and read a few posts. You'll find me on there.....I'm the unofficial "guru" for the older Motorolas. I have all the instruction manuals and can tell folks how to work the bells and whistles. I also know places around the USA where you can still get batteries and leather cases for the Brick.

Hey Toll;
Part 95 really doesn't say that owning or having a modded radio is
illegal. Part 95 DOES say that, do not modify the transmitter, if you
do you lose type acceptance. That doesn't mean that its illegal to
posses, just illegal to transmit with. This is different than a
manufacturer that has to meet type acceptance to be able to sell the
radio.

>
>Once modified, it CANNOT be listed under Part 95 for Type Acceptance any

Not just being able to transmit is not illegal, actually transmitting
is (by what part 95 actually says)

>
>That is why RedCo (and later Digi-Log Technologies) had to include a way to

Oh really now, Sean..

If you really believe that the article in PopComm is going to get everyone busted, you are living in a fantasy world.

The FCC actually interviewed Digger (I believe it was... Could have been Rock & Roll.... I forget who I was told it was) at one of the keydowns in Dave's backyard. You want to jump all over his ass over that? I mean, he sat their bragging about the big stations, TO THE FCC!

Nobody from channel 6 submitted that article. Whether or not the article was written had no bearing on anyone that you, or I for that matter, know. By allowing them to use my web site, I was given the liberty of being able to proof the copy before it went to print. Without that liberty, peoples vehicles, license plates, names and other identifying marks would have been printed. Now you tell me what the worse offense would have been?

To think that an article in PopComm would endanger the hobby to the point of extinction is ludicrous. Did it hurt the "anonymity" of the hobby???? Maybe.. However, would you have rather that we let your name be in the rough draft and be put in print along with your shops name as one of the people who helped along with this hobby of ours? No, I seriously doubt it.

Having a page devoted to where the keydowns are maybe a bad idea.... But then again, I have brought a lot of people who would otherwise not have known a damn thing about them to breaks.. And to think that the FCC doesn't know where these are held if a fucking joke... I mean.. Do you honestly think that the FCC doesn't have the information on where the Tyler break is held every year? Or the Hot Springs break every other? Give me a break.

That is called living in a dream world.

I also find it somewhat funny that you never said anything about that in the past, but only choose to come out to chastise someone.

Have a nice day.

> wouldn't mess with it unless you want to use the radio to hunt down carriers or fox hunt.

That pot does absolutely nothing to increase the RX on the radio. If you look at a schematic, it feeds the LED generator IC a small bit of voltage. It is just the adjustment in the network to do so.

>
> The TX pot. is for the L.E.D. meter it just adjusts the lights for transmit power, and In no way
> does it increase your out put.

Agreed.

>
> Then if I'm correct the next pot. is for your Squelch and it just adjusts your squelch treshhold
> .. I wouldn't suggset messing with it, but you will not hurt the radio if you do.

> increaseing the power. But I wouldn't really try to push it past 5 watts.

The Pro-510 (or mightly Midget, as it is sometimes called) will do close to 7 or 8 watts AVG power output when tuned correctly.

It is just as good an AM transmitter as any Galaxy or other radio. Put a D-104 on it, and you will never see the difference between it or another radio on AM.

I had a guy tell me that he was moving to Philly PA. He said that he
wanted the HF rig. He said he would call me Friday. Well its saturday
and I have not heard from him. His offer was a Kenwood all mode 2-meter
rig. So I'm reposting what I have for sale or trade.
I have an ICOM 740 HF mobile that I would like to sale or trade. I'll
Take 300.00 cash plus shipping thatï¿½s about 25.00 give or take. I trade
It for a Pentium 233 socket 7(I will consider any other Intel Pentium
Computers above 120 MHz) with at least 2 gig hard drive and 32 Megs of
ram, 56K V.90 modem,(I will consider 33.6 and 1 gig harddrive) Keyboard

Mouse and 13in svga monitor. Or I will take a 2-meter all mode base rig
Digital readout. Tell me what you have to offer for this HF rig.
The ICOM 740 is the stock IC-740 it has no power supply it runs
Strictly 12 volts DC. The rig is in good clean shape and I don't smoke
and the guy that had it before me doesn't smoke. I was the third owner.
I ran the rig in the mobile. The rig covers all the ham bands. It
Doesnï¿½t have a continuous coverage receiver. The rig has both sidebands
CW
And RTTY as far as modes. Its dimensions are 111mm (H) x 286mm (W) x
374mm (D). Itï¿½s rated at 200 watts input. I will include stock mic and
instruction manual.
Drop me a line and make offer
73 from Oris

I think it was the half-wave version. It seemed longer than 17 feet
though, but for a half-wave I know that is the proper length. I think
it did have 4 sections. I had it on top of a two story roof with two
sections of 10' mast. I could see the top of my antenna from across
the neighborhood. That antenna really worked great.

This is true. People couldn't believe that I was running a stock
mobile 40 channel with factory power mic, it was a GE radio. This
radio/mic had the distinction of emitting a very short "ting" when the
mic was keyed. It was almost unoticable but it certainly gave the
radio a distinct sound.

From what I understand about the interference problems going on. It is the TV & RADIO STATIONS that need to buy & install filters on their antennas. Were my 10-20 is we get a lot from WTOP & there have been a lot of complants going on & so far they have done nothing about it. They say that people should install filters on there telephones, TV sets. So I do not know what will happen. I am still checking in with the FCC web site (http://www.fcc.gov) to see what will happen.

2177. FRS in Europe?

Newsgroup: rec.radio.cb
Date: 1999-09-11 00:00:00 UTC
From: dpbsmith@world.std.com
Message-ID: <FHwoyz.JqB@world.std.com>
Source record: 2177
Cross-posted to: rec.radio.cb,rec.radio.amateur.misc

(If there's a more appropriate newsgroup, let me know...)

Just bought a pair of Cobra Microtalk 1's in anticipation of a cycling trip in the Netherlands, when I suddenly wondered... what's the FRS band used for in Europe? If we take them to Europe and use them, what happens?

a) Everything's fine, FRS band is international
b) Technically illegal but the radios will work and nobody will care
c) Won't be able to talk because we'll be drowned out by Dutch foithboinders sending frammis traffic on that frequency
d) Every time we press the talk buttons we'll set off Dutch blasting operations and crash Dutch helicopters
e) Dutch FCC will follow us with RDF vans and haul us to jail

2178. Re: How do I stop this overpowered yahoo?

Newsgroup: rec.radio.cb
Date: 1999-09-11 00:00:00 UTC
From: AB7RS <tglenn@imt.net>
Message-ID: <37DA9C5E.F5@imt.net>
Source record: 2178

Use a handheld CB and use your body to block the signal(with the antenna close to your chest turn around till the signal drops off,then he is right behind you)and when you get close enough turn the antenna horizontal for some cross polarization attenuation then take the antenna OFF,you should be right on him.
The FCC might do something IF he is doing something wrong.

Source record: 2194

i have to agree with wildcat.
the state police had no business even asking the operator to inspect his station.
here in florida, the confiscation and forfiture laws are so broad that if you are pulled over with a 10 pound bag of baking soda in your trunk and the police think it's drugs, they will take your car.
even when you're found innocent, it takes filing a civil suit to get your car back. if you don't believe me, check it out.
the reason being that the confiscation was a civil forfiture and not subject to the same laws as a criminal evidence confiscation.
there have been people pulled over on alligator alley, (an interstate type road)
with large sums of cash. the cops search the car, find the cash but no drugs or guns.
they take the cash and give a reciept and tell them to file a claim if they want their money back, (which if they are smart they'll hire a lawyer to do), and then let them go. getting they're property back is a hard process because the jurisdiction that confiscates the property keeps most or all of it and uses it for police funding. it's ok if the person is found guilty of a crime involving the property but it doesn't require a conviction to loose your property here.
all of this is under the ASSUMPTION that it's drug money. some people don't believe in banks and may be moving down here with their life savings. dumb idea but it's still their right to be dumb.
what if the police took the word of cox cable and automatically assumed that the ham was transmitting out side of his authorization and confiscated his equipment? were any of these police trained to recognize the difference between legal and illeagl equipment?
something that a lot of people don't think about is they think that the texas star, magnum dave made and other "cb" linears are illegal. they're not. a licenced ham can use any of these broad banded 2 to 30 mhz linears on 10 meters or below with in his power limits if it's rf clean. if a cop, who pulls over a licensed ham, looks in the guy's car and sees a texas star like the one he had when he was a kid, can he take it away?
if he's not trained in what a ham can or can not use it could be confiscated even though it's perfectly legal for the ham to have and use it.
just a few things to think about.
jeff

as far as commerical broadcast stations interfering with consumer electronics, specificly cordless phones.
a local fm radio station put up a new tower and fired up it's 100+kw transmitter 1 year ago within 1.5 miles of my house.
with that service, we got music on hold and over any conversation on our new 49 mhz cordless phone. we called the station and complained. they asked when it started and we gave them the date.
they said that was about right and asked our address. 2 weeks later their engineer hand delivered a new 900 mhz spread spectrum phone, (problem solved), to our door and said the station did it as a courticy.
i thanked him and we discussed the situation and i asked about the rule that said that the operator of a transmitter was responsible for any interference they caused.
he pointed out the label on my 49 mhz and the 900 mhz phone and even on my pcs phone where it said that it can not cause any interference and MUST accept any interference even if it caused undesireable operation.
i thanked him again for the new phone and shut my mouth.

<< Do you honestly think that the FCC doesn't have the information on where the Tyler break is held every year? Or the Hot Springs break every other?>>

Correct, I imagine they do. And that they did long before the POPCOMM article appeared. So, common sense would tell you that if you were cool and kept a low profile, the underfunded FCC would continue its policy of ignoring you. But the ironic thing is that you guys cannot resist bragging, boasting, and strutting your stuff in public. You are anxious to get your faces on the web, your stories into national magazines, etc. Your "hobby" seems to be less about technical achievement and more about ego. And that will likely be your downfall. The POPCOMM article certainly got some attention, and probably was a welcome addition to the portfolio of those sponsoring the Ehlers Bill. The FCC may be underfunded, but they do not like negative publicity. Legislators do not like their constituents reading articles about 70KW unlicensed radio transmitters. You've heard the old saying that "lightning strikes that which stands out".

No part 95 really doesn't state that. Capabilities make it non-type
accepted. It doesn't become illegal until you actually use it to
transmit.

>
>Same as a linear... Having the capabilities (Having a linear in your
>posession) is the same thing as using it.

Yes, this is clearly spelled out in part 95. Having a linear in your
posession is illegal unless you are a licensed amateur. Its not
clearly spelled out for having a modded CB in your posesson.

>for $10 bucks. It really worked great. It seemed about 30 feet long.

I think the model with the "loops" at the top was a Radio Shack half-wave. How many sections did the antenna have?

The half-wave had four sections, around 17 feet tall, "loops" on top, and three short (52") radials on the bottom. The 5/8 wave had five sections, 19' 10" tall, three static disapators (looked like mini-radials) on top, and three long radials on the bottom.

>
a cb transmitter (ie) a transmitter used in the cb band that is
type accepted must not be modified
if it is modified then it is nolonger a type accepted cb transmitter
operating a non type accepted cb transmiter is illegal
a transmitter that can operate in the cb band is not a cb transmitter
a transmitter that transmits in a cb band is a cb transmitter
a transmitter that transmits is a station
a transmitter that don't transmit is not a station
(ie) you can not operate a non type accepted cb station or cb transmitter
cb station = cb transmitter
you can own a non type accepted transmitter that can transmit on the
cb frequencys
it is illegal to have a not type accepted cb transmitter or station

ex the spelling

Greetings!

While Dancing with the Mouse on Fri, 10 Sep 1999 17:19:11 -0500, the Modem interrupted with an MNI from ""Gunsmoke" <rwilliams@megsinet.net>", and the MotherBoard buffered this to Video RAM:

:+> My cat fell asleep on my coax last night. I didn't see him there so I
:+> started transmitting. Will he suffer any long term effects from this? I am
:+> worried that his hair will start to fall out.

I have found an old copy of Alice In CB-land...

"...As I sat there, Chesire slowly began to appear with that Grin. Unable to contain myself, I reached for the Microphone connected to that little black box.

The Cat continued to re-appear, it's eyes staring back through those little ebony slits.

I pressed the button on the handset.

With a smoky phoof, followed by a howling wail of distress, Cheshire dissapeared rapidly, leaving behind an acrid smell of burnt fur..."

The point?

Just be lucky your Cat, is still a Cat.

Regards!
:+> Andy <+:

Who's going to Memphis ? Probably the FCC, thanks to the brain surgeons
that submitted an article to Popular Communications. I have yet to see the
actual article or find out who submitted it. I haven't been on the puter
much to read this group, so i don't know if anyone here was involved.

I have not been able to find an actual copy of the magazine, so i can only
go by what i have heard about it. From what i have been told appeared in
the article, it appears that the author was lacking common sense and
forethought and may have done grave damage to our hobby and possibly alerted
the FCC to our private gatherings. Having links that advertise such events
on a website also doesn't seem to be such a good idea to me. I guess that
we'll have to wait and see. I hope that this doesn't come back to haunt us.

<<Ok, got a problem. There's someone in the area who has his radio cranked up so bad it bleeds through my computer speakers. Is there any way I can locate where he is, and will the FCC do anything about it if I complain? It's getting really annoying, he's a real loudmouth.>>

Is it Toll Free?

I'm kidding.

Seriously though, I've seen this question come up a number of times in this NG. Invariably, a number of childish responses will advise taking violent action and/or destroying property. There is an FCC 800 number posted on their website for CB interfernce complaints. You could try making a complaint, but I doubt there will be any response. The FCC is severly underfunded and cannot provide adequate enforcement, except in severe cases. You could try explaining the problem to the guy in hopes he will attempt to find a solution. If he refuses, you've probably got to live with this loudmouths interference, or take steps to shield your components from his stray RF. Unfair? You bet. That's why there is an Ehlers bill currently before our legislators - to give local police the power to step in in and help resolve these kinds of problems.

I love messing with the number collectors. A number collector is one of these guys that get on a
SSB DX channel and look to get just club numbers. Thats it, it is a real ego booster in their
eyes to have as many numbers as possible then come on to the AM mode and spew these numbers at
you like a trophy. Well to me, "I could give a 150 butt tons compressed too, I DON"T GIVE A FUCK!"

One local individual was like that so a friend and I made up numbers. For example: Victor Ida
Nora numbers. That is the Phonetic alphabet that local athorities use. Which actually stands for
VIN, as in your cars VIN number. We took our VIN numbers and spewed them back at him and told
him it was an older club that was pretty prestegis to have these numbers. He went ape shit and
had to have one and kept bugging us to find out where he could get one. We laughed our asses
off.

One of the potentiometer is for RX which just raises the the receive lights and does increase
your receive a tad, but normally it just opens up your ears to adjacent cahnnel interference. I
wouldn't mess with it unless you want to use the radio to hunt down carriers or fox hunt.

The TX pot. is for the L.E.D. meter it just adjusts the lights for transmit power, and In no way
does it increase your out put.

Then if I'm correct the next pot. is for your Squelch and it just adjusts your squelch treshhold
.. I wouldn't suggset messing with it, but you will not hurt the radio if you do.

As for power adjustments without reffering back to a schematic I can't tell you what to do for
increaseing the power. But I wouldn't really try to push it past 5 watts.

The ham allowed himself to be violated. I imagine because he had
nothing to hide. Nothing to be afraid of. "Sure, c'mon in!"
The one's who refuse probably are doing something wrong. I know I
don't have to let local law enforacement in but you know what? I'd do
the same thing. C'mon in! I'm legal as can be. Nothing to fear.

>This is a prime example of the law enforcement community automatically
>aligning themselves with a corporate entity, if the corporate entity is

True to a point. It would be a benefit for all if the ham HELPED try
to solve the problem. If the ham helps and does what he needs to do
then he can say "sorry, I tried". The cable company should checked the
wiring outside and inside as well.

>These are the only 3 legal remedies to this scenario however Cox Cable Corp.

>It's getting really annoying, he's a real loudmouth.

Common problem. Is there anyone else in the area complaining? If
so, try locating the station. Log down the dates and times it happens.
Try nicely approaching the suspected person and try to resolve it. If
there are enough people in your area complaining MAYBE the FCC will do
something. IF the station is running legally there's not much you can
do except filter your equipment. Local law enforcment really can't do
much, I hear they are try to change the laws on this is some states.
However if the person is operating legally you can't stop him if he's
licensed.

Without looking up the full spec's, am I right in thinking that the 2500 denotes anode dissipation?

Are the HT and heater spec's also the same as it's cousin?

I like the idea of 'an easy 10K'!

I take it this is in your shoot out mode of class-C AM and with a minimum of 'four' big Electrodynes?

I recently acquired a UK dealership from Electrodyne and hope help find a market for them here in the UK.

I have it in writing that their largest unit can crank out 385A but at a rather high 5000+ RPM, not the ideal IMHO.

Now working on this rating each alternator can push out approximately 5KW. Have I got my calculations into the ball-park?

One also has to take into consideration the losses in the Dahl transformers!!

On a separate note a colleague of mine is currently construction a class-E high voltage FET amp as published in an old Comm's Quarterly magazine - 700w of CW or 250W of AM for under 10 dollars.

We intend using a class-S modulator, in other words PWM.

Phil / UK

Hello Graphics Mastro: Nice screen name there.

First thing, you really don't know the guy is over powered or not. A lot of interference problems with audio equipment can come from a normal stock radio. What happens is that the transmitted radio energy gets into the computers speaker system, either from the power cord, or speaker leads. From my experience, the speakers leads are the one that pick up the RF energy. This can easily be fixed. This is what I would do:

1- Let the radio operator know that you are experiencing radio interference to yours computer speaker system. In a polite and mature way, you always get more flies with honey that vinegar. Maybe even phone numbers can be exchanged?

2- Shorten the length of speaker wires, by coiling then into about a 2 to 3 inch coil diameter. This may reduce or eliminate the interference. If the interference is still there, then I would install a .001 disk capacitor (available from Radio Shack) on the speaker terminals itself, and wrap the speaker wiring around a ferrite core. Also available from Radio Shack, part number 273-104

3- There is a good book called, "The ARRL RFI BOOK" Practical Cures for Radio Frequency Interference. Available at http://www.arrl.org/catalog

4- Even if the bill that Hooligain2 said was to pass. Do you really think law enforcement will help you. They may pretty busy as is. It always best to handle things your self, in my book. Guys like Hooligan2 want government to spoon feed them, and whine a lot. Whaaaaaa.......

Jay at jay123a@qnet.com ..... In the Great Mojave Desert, (At least that's what the real estate guy said) just down the road ah ways from the fillin station. Needin to get ready for winter, Miss Dinah has pipe coverins, duct tape, pipe heaters, and small area heaters fer your well sheds. Also has new heavy jackets that make ya look like a Red Neck Desert Rat, but then again, ain't ya?

>Hello Bill: You would be better off with a Penetrator 500 a 5/8 wavelength
>antenna. A hole lot less neighbor interference problems, and it gets out
better.

Right. But make sure you have the Penetrator mounted high enough so the base (ground plane) is ABOVE neighboring TV antennas. Since this antenna is such a strong performer, it will cause TVI to antennas which are directly in line with it. I once had one on a 10' mast on the roof. Neighboring TV antennas were also mounted at 5-10 feet above the roofline. My signal radiated right into their antennas. Simply raising my antenna to 25 feet above the roofline eliminated all interference problems AND caused me to get out and receive better as well.

You're refering to the article entitled "CB's Super-Power Bad Boys Or Organized
Chaos" in the September issue. Lots of pictures and references to mobiles
running 70,000 watts.

Yes, I would expect the FCC has read the article and probably will send a few
"representatives" to upcoming keydowns. With all those "big radios" and their
operators converging into one central location, it will be like shooting fish
in a barrel.

If you are just turning things in the radio, not changing transistors or anything, keep the power down to about 50 watts PEP output.

Toll Free

Hello RFEnforcer: Yes a great point made here, I agree. Buy putting the Penetrator 500 up as high as you can, it will reduce interference problems and reduce noise picked up from the power lines ect. And you'll be accused of being a big strap, Ten-4.

Jay in the Mojave

I'll be travelling in the next month where I'll be renting a car. I'll be doing alot of driving and plan on bringing my handheld CB with me. However, I'd like to put an external antenna on the vehicle to couple with this radio.

I've seen some "thru the glass" antennas by Solarcon and Midland and I'm curious if they'd be ideal for this purpose? Are they any good?

Keep in mind the antenna has to be small enough to fit in my luggage (air flight) and something that won't potentially damage the rental car. Small magmounts might work, though I don't know which ones would be best and fit in my luggage!

-Skorzy

the through the glass antennas have to be stuck on the glass with double sided foam tape. you'll be scraping it off and replacing the tape every time you change rental cars. short mag mounts arn't very good either but would be your best bet given your space limitations.
good luck
jeff

If the ham is radiating harmonics or spurious signals that fall into the
TV or cable frequencies, then it is his responsibility to clean that up.
If his signal is clean, then it is up to the TV set owner and cable
company to clean up their act.

ok, you might be able to find some cheap ones around for crystals!! you might want to try a swap newsgroup once even!! Check in Popular Communications Magazine if you can get it over by you. Ive seen ads for cheaper onces myself. What would you consider fair for the radio, You can quote in pounds then I can converte it to us here. Also check for a Ham Fest by you (Amatuer Radio Swap meet), I picked up a scanner for free going to them!! (just needs volume fixed!!)
Good luck on getting a station going.

Toll, You are getting 2nd hand info that is far from correct,I kinda know where you got the info from up " North". But to set the record straight, Digger was not at the Atlantic City break, Rock and roll also never has talked to anyone with the FCC either. But the guy who was there that everyone thought was an FCC agent his name is Frank "RF Burns" a avid ham operator/Cb'er from Central NJ , who is also a video enthusiast by profession , only wanted to make a documentary on BigRadios, Keydowns, Wildest looking Mobiles etc. I know him personally and he is far from a FCC Agent. He drew the attention of the crowd while walking around at the motel and the killing fields with a professional looking camera asking questions and filming mobiles, and handing out flyers promoting this video he was trying to make. #425 "who went to the break with Rock and is also a tech with Dave actually took the guys tape out of the camera after he agreed to do an interview of sorts with him #425 then would not return it to him. I guess he was a little paranoid after the interview was filmed and more than slightly drunk when he took the tape away from "Frank" but never the less I was at the hotel and I competed and there was no one talking to the FCC . Just wanted to clear any unture rumors you may have heard regarding this incident.
from him right out of the camera, because he dinot want to be on it

Installing any sort of filters at the radio or TV station isn't going to
stop you telephone from acting like a radio receiver, that is strictly
the fault of the phone. Also applies to stereo systems and other cheap
electronic devices.

That radio station was a class act. They did the right thing. Courtesy is the operative word.

I mean, what if (like some CBers advise doing with victims o their interference) they just pointed to that consumer warning label and said "Tough S**t buddy") ?

pllo2a@aol.com (PLLO2A) wrote:
<<as far as commerical broadcast stations interfering with consumer electronics,
specificly cordless phones.
a local fm radio station put up a new tower and fired up it's 100+kw transmitter 1 year ago within 1.5 miles of my house.
with that service, we got music on hold and over any conversation on our new 49 mhz cordless phone. we called the station and complained. they asked when it started and we gave them the date.
they said that was about right and asked our address. 2 weeks later their engineer hand delivered a new 900 mhz spread spectrum phone, (problem solved), to our door and said the station did it as a courticy.
i thanked him and we discussed the situation and i asked about the rule that said that the operator of a transmitter was responsible for any interference they caused.
he pointed out the label on my 49 mhz and the 900 mhz phone and even on my pcs phone where it said that it can not cause any interference and MUST accept any interference even if it caused undesireable operation.
i thanked him again for the new phone and shut my mouth.

2265. Re: FROM WARNINGS TO ACTUAL FINES

Newsgroup: rec.radio.cb
Date: 1999-09-11 00:00:00 UTC
From: pllo2a@aol.com
Message-ID: <19990911173126.27474.00008051@ng-cr1.aol.com>
Source record: 2265

why does this news group tolerate braking the law???
show me your badge or leave town sherrif.

2266. Re: FROM WARNINGS TO ACTUAL FINES

Newsgroup: rec.radio.cb
Date: 1999-09-11 00:00:00 UTC
From: pllo2a@aol.com
Message-ID: <19990911172338.27474.00008049@ng-cr1.aol.com>
Source record: 2266

the only newsgroup where breaking the law is tolerated??? it is no violation of any law to TALK, WRITE OR POST radio mods anywhere. that's why they haven't taken cb mod books off the market.
have you not heard fo free speech???
you must not get around the web much, do you??? there's a lot worse stuff out there like hate, predujest, nazism and others that would make any sane man sick.
and where do you get off saying an illegal minority controls what is said here???
it's the hams who are trying to squelch the free flow of information here!!!
this ng is not reserved per se for anyone but the listed subject IS cb of which freeband is more associated with it than ham wether you like it or not.
if you click on the little blue arrow at the top of the posting frame, you'll find a rather large list of news groups in which you'll find 1 cb ng and 10 ham related ng's.
if you don't like what is said here, i suggest you click on one of the other ham related ng's where you'll find more people who are aligned more with your views.
no one is excluding legal cb'ers from this ng.
i have not seen one posting by an outbander slamming a legal cb'er for their activities. i and other outband supporters have offered help to them without giving them a hard time.
on the other hand when someone asks a question about outband operation, some ham has to jump in with his 2 rubles worth and spread his ARRL union line and waste the poster's time reading it.
it goes along the line of, if you don't have something constructive to contribute, SHUT UP!!!
jeff

Hello Hooligan2: It has been pointed out to me that whiners and people who want the government to spoon feed them, like you, don't necessarily wear the paints in the family.

You bet I would, I've served my country well, and paid incred-o taxes, and I am damn good lookin. Give out good CB Radio advice, I'd bet that they would want me at the front of the line, Ten-4.

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the road ah ways from the fillin station. A good friend to Big Bob, famous CB'er and flossifier. Big Bob would say things like: "Ah good man will tough things out, and take ah few lumps as well, but he shouldn't half to stand in any line with whiners, or none CB type ah guys, Ten-4"

RHOOLIGAN2 wrote:

Yes, you can.

But, then again, all road signs in the US are very distinct, and they all have only one meaning, so they can show you the signs, and you have to be able to tell them what that shape / color scheme means.

If they did not do that, the ACLU would be all over the NHTSB for discrimination of people who couldn't read!

Sad, but true.

10-7,

First off, nobody from up north said a word to about it to me.

I haven't talked to Dennis in a couple months..

Sean, well he seems to have decided after Memphis that he would blow me off... Oh well. If he doesn't want to tell me why he won't talk to me, that is his loss. If it is a misunderstanding, I have more than once written him an email.

The person that relayed this story to me was from the south, in the south, and I took him to be somewhat "in the know"... Maybe he was wrong...

Point is, the FCC has known of CB radio breaks for a lot longer than most people that currently go to them.

For the people who think that the article in PopComm did damage, I surely wish that I could release the first draft that I was sent. It named names, license plates, etc. People would have been busted, or put in the spotlight a lot more than they where with that article.

And as for Joe, he will continue to post drivel that downs anyone that disagrees with him, proving that he is a bitch that cannot leave anything alone. Oh well.

I have given up on this topic. Thanks for the input. It did set the record straight, and I will talk to the person that gave me the info.

wrote:

>Who's going to Memphis ? Probably the FCC,

I have to agree with you here. Maybe for different reasons but this
is my opinion.

Normally i would think that the underfunded, undermanned FCC would
not care to even take a second look at a keydown. The underfunded,
undermanned FCC may not even know about the exact dates or
locations of these keydowns. Regardless of what is correct here,
something has changed now.

The publicizing of this keydown in a major communication magazine, and
the glorification of the participants and equipment involved has to be
seen as a slap in the face to the FCC. Don't get me wrong here. I
don't have any negative opinions about these keydowns. It's just that
when it is rubbed in the FCC's face it may force them to find the
funding and manpower to stop the embarrassment of their inadequacy
that these keydown make evident.

This scenario is similar to the mistake that Jack Kevorkian made. He
flaunted and dared law enforcement to shut him up. They did. If he
only went about his business without making a scene, he would
probably still be doing it today.

Toll, Thats all I was looking to do was clear the record abit. I heard the same rumor only 1 day after the break and it was from a guy with ties to the Chicago connection so I assumed this was where your info may have come from. I think there were more FCC rule breakers in one place at the Dayton Hamfest than ever has been at a keydown. Although yes they are against fcc rules, keydowns do no more harm than most any other "Sporting Event" for instance Ever try living near a race track, who wants to hear smokey burnouts, jets cars, 500+ HP cars taking off continually all day and nite, certainly not me but you'll have that.the same goes with keydowns yes the critics will say ohh it messes up the band with bleedover etc, yes for very short periods of time 10 seconds max if you are local to where they are keying you may get some splatter but only when the really big guys are keying and then it is only maybe 10 keys max for 10 seconds perhaps. enuff said.

2282. FS: 66xl $45 (2) 148GTL-ST $125 (1) Clarion JC211e $40 (1) Washington $185 (1)

Newsgroup: rec.radio.cb
Date: 1999-09-11 00:00:00 UTC
From: jouc@oit.edu
Message-ID: <37daca41.13330714@news.jps.net>
Source record: 2282

All radios in great shape both physically and cosmetically:

(1) Clarion JC211E $40 all controls in microphone
(2) Uniden PC 66XL $45 w/ Cobra Stock Mic
(1) Cobra 148 GTL-ST $125 w/ Diesel 4-1 Mic
(1) Uniden Washington $185 w/ Cobra CA-72 Compression Desk Mic
I also have a linear amp up for grabs

(1) Cobra 200 VM $125

And this is just a real old working radio

(1) Realistic TRC23C Base $15 w/ superstar power mic

Shipping equal to or less than $10 anywhere in US except for the
Washington Base

Chris

You have now crossed the line from moron to complete dick.

What if the guy knows not that he is bleeding?

What if the guy has a radio that he bought used, and only has a base setup.

Although this is somewhat far-fetched, it is possible, and for an idiot to try to get the guy busted right off the bat is stupid.

The correct thing to do would be to introduce yourself to the guy bleeding, explain what was going on, and if you met with resistance, then screw him over by becoming a snitch.

Pee Wee, you need to make up your mind to come down to earth with the rest of the humans if that is what you want to do... Otherwise, quit trying to converse with us because we are tired of laughing at you.

No, asshole, this is right.

At many of the "ham-fests", you will find old CB radios, antennas (from hams who finally bought a multi-bander and can now scrap that "10 meter Penetrator 500) and the such.

You seem to be the first person to attack someone for posting about a hamfest in this group... Why doesn't that surprise me, Pee Wee.

Go away.

Hollingsworth had 1 person busted, and another warned.

What is really funny, seeing as how you want to bring it up, was their where more HAM RADIO manufacturers busted at the ham fest than CB linear manufacturers. One CB manufacturer, and a couple people selling amps that where capable of operation (although they where old, used amps....) Seeing that they where in the original condition that they where originally sold in, the FCC could do nothing but issue warnings.

Seems like you have the store crossed again, asshole Joe.

A firewall has nothing to do with double posts to a newsgroup, as long as you have your client configured correctly...

Then again, a firewall would still have nothing to do with the double posts.

Many, many people on this newsgroup post from megsinet.com, and he is the only one having this problem.

Some people call it intentional... To attract attention.

Yes joe, 10 second keys are the norm at akeydown, yes they test them at home ever heard of a dummy load. No, Most don't use them to talk on 11 meters, they are not made for long winded conversations since they are like race cars, built on the edge of performance , why would they risk big dollars to talk skip and chance ruining the tubes alternators etc. But I guess you see Big Daddy Don Garlits running down the street in his Dragster. Your an ass who probably was run of 11 meters.

Mr. King,

You must have really enjoyed your CB back then. There were a lot of good times to be had by everyone then. At least in the early 70's when everything was all proper and there were get togethers/breaks and no-one let any lame get away with cussing or annoying B.S.
I wish those days were back. But some people don't know how to have good clean fun anymore. Now when you want to meet the few people that know how to have good clean fun you have travel hundreds of miles. Sad day.

<<keydowns do no more harm than most any other "Sporting Event" for instance Ever try living near a race track, who wants to hear smokey burnouts, jets cars, 500+ HP cars taking off continually all day and nite, certainly not me but you'll have that.the same goes with keydowns yes the critics will say ohh it messes up the band with bleedover etc, yes for very short periods of time 10 seconds max if you are local to where they are keying you may get some splatter but only when the really big guys are keying>>

Truth is -- you have no way of knowing what part of the spectrum or whose communications are being "messed up" when one of the "big guys" keys his mobile.

It's like going out to a clearing in your local park and firing a 50 caliber machine gun toward the horizon for 10 seconds. Those rounds can go for a mile or more, but since you can't see where they land, no harm done, right?

Yeesh. No brains.

It was definably a different generation, before the introduction of pagers and cellular phones. C.B. radio was used as a mode of communication, ..can you imagine?

The one item that sticks out is the willingness of C.B.'ers to assist others. From the proliferation of local REACT teams that actually monitored CH 9, 24/7 to individuals that offered road assistance and directions for travel on CH 19.

One such person that deserves distinct recognition was an older woman from central NJ know as "Pigeon Base."
Through the 1960s thru the 70s she monitored CH 19 nearly 24 hours a day, offering weather alerts to truckers traveling along the New Jersey Turnpike and relaying phone calls to those who were stuck on the road.

She was also responsible for coordinating many charitable events that were quite common to C.B. at that time. Her popularity with the families of the OTR driver and volunteer spirit was legendary.
When she passed away I recall that close to 100, 18-Wheelers showed up for her funeral. The outpouring was so great that the NY City and Philadelphia television media covered the story.

I believe that I still have the issue of 73 Magazine from the 70s that printed her obituary, along with a stack of 30 others that somehow survived all these years.

After two defective ABS 1600's, I put up an IMAX today. I modified it a bit, added a modified Maco ground plane. Has 1.1 swr barefoot, 1.8 swr under power. Seems to work well, definately better than the ABS, or maybe I just got two bad ones in a row.

We can still do that alone with all of that becaue CB use is free & if the FCC were to charge again then it is a 1 time fee!

<<What is really funny, seeing as how you want to bring it up, was their where more HAM RADIO manufacturers busted at the ham fest than CB linear manufacturers. >>

Not funny at all, unless you fantasize that hams want to punish CBers while gleefully committing illegalities themselves. Truth is, they welcome Hollingsworth's attention to keeping amp manufacturers in line whether they be ham or cb oriented companies. Since you seem to know all the details what went on at Dayton, how about sharing a list of the manufacturers who were fined or warned so that we can all see it?

Greetings!

A Short mag mount will work. Something along the lines of a 36" one that can be disassembled rather quickly and easily.

Cobra, http://www.cobraelectronics.com/ has a good selection. The one I particularly like, is no longer in production. It was a Black CMA-36 I think, and had a small 4" magnet - all black with a powder coat on the whip. Nice, slim profile for not too noticable antenna for the trips with a little Handheld HELP radio from R/S. As far as performance, it wasn't the best, but did well for channel 19 traffic.

It was center loaded, and there are some of the same type out there that are 18" when disassembled and rubberbanded together that are now chromed, but they work well.

A lot of places that sell CB's on the net have antennas and all the adapters you'll need to get you up and running.

http://www.coaxkid.com
http://www.bills2way.com
http://www.copper.com

... are some sites that are worth a visit to see what they can set you up with. In order of variety...and customer service...as in replies and Emails plus ordering. The first two I recommend highly.

AS WITH ANY ANTENNA...

Location is important! I can't stress this enough. An antenna on the Roof of the car is going to perform better than an antenna on the Trunk Lid or Hood.

IF YOU DECIDE TO USE A MAG-MOUNT...

Mag mount antennas are great for stowaway, but they do have a VERY STRONG MAGNET, than can ruin tapes, diskettes, goof up calculators, even magnetize or stick to things you wouldn't expect. Buy a large flat washer or even a piece of flat stock steel of a thin gauge to help the Mount contain the field within itself. It'll act as a keeper for the magnet and help keep debri and small objects from contaminating the botton thinly coated bottom with stuff that can leave a scratch or ring where the antenna was on the Rental car, or your own vehicle.

This will also help you in Airport Terminals where sensors are used to detect weapons. Ferrous materials set these things off, so a keeper on the magnet is recommended to keep the rest of the stuff in your bag

from "Adhering" embarassingly to the magnet during a search.

While Dancing with the Mouse on Sat, 11 Sep 1999 11:19:28 -0400, the
Modem interrupted with an MNI from "skorzy@SPAM_KILLER.mindspring.com
(Dr. Skorzy MacFarlaighn)", and the MotherBoard buffered this to Video
RAM:

:+> I'll be travelling in the next month where I'll be renting a car.
:+> I'll be doing alot of driving and plan on bringing my handheld CB with
:+> me.
:+> However, I'd like to put an external antenna on the vehicle to couple
:+> with this radio.
:+>
:+> I've seen some "thru the glass" antennas by Solarcon and Midland and I'm
:+> curious if they'd be ideal for this purpose? Are they any good?
:+>
:+> Keep in mind the antenna has to be small enough to fit in my luggage (air
:+> flight) and something that won't potentially damage the rental car.
:+> Small magmounts might work, though I don't know which ones would be best
:+> and fit in my luggage!
:+>

My responses to Toll's statements are below his and start with several arrows (>>>) for easy identification. Sean

Toll Free wrote in message ...

By allowing them to use my web site, I was given the liberty of being able to proof the copy before it went to print. Without that liberty, peoples vehicles, license plates, names and other identifying marks would have been printed. Now you tell me what the worse offense would have been?

>>> What you state here is that all of the information that you denied Pop Comm from using can already be found on your website (license plates, names, etc). That means that you have already put these people at risk. Another thing to think about is this: Do you actually believe that if the FCC confronted the "old school / old timer's" at Pop Comm that they would not reveal their source of info ?

To think that an article in PopComm would endanger the hobby to the point of extinction is ludicrous. Did it hurt the "anonymity" of the hobby???? Maybe.. However, would you have rather that we let your name be in the rough draft and be put in print along with your shops name as one of the people who helped along with this hobby of ours? No, I seriously doubt it.

>>> I have already been there and done that. Why do you think that you never saw me pushing specific products or advertising items for sale ? Arguing technical points in a public forum and advertising something that the Government considers to be a criminal activity is another story.

>>> I have had "the boys" looking for me. This was long before i ran a shop and was doing radio work out of my house. At this time, Dennis and i were rivals and competing against each other for business. Even with the anomosity that existed between us as competitors, Dennis was alerted to the fact that they were looking for me and was kind enough to let me know what was going on before anything went down. I would have done the same for him. The "boys" are still around and DO pay visits on occasion. Those of us that have been around know that any added attention is only a BAD thing.

Having a page devoted to where the keydowns are maybe a bad idea.... But then again, I have brought a lot of people who would otherwise not have known a damn thing about them to breaks.. And to think that the FCC doesn't know where these are held is a fucking joke... I mean.. Do you honestly think that the FCC doesn't have the information on where the Tyler break is held every year? Or the Hot Springs break every other? Give me a break.

>>> No, I honestly do not believe that the FCC was aware of any scheduled events. As everyone knows, these are typically held on Holiday weekends. This puts most of the agents at home with their families barbeque'ing and

caring less about their jobs. Most normal people are out and about, enjoying their time off of work. Interference MAY NOT be noticed quite as much for those reasons.

>>> Regional keydowns are also very infrequent (once a year) and they may not have noticed any specific patterns regarding time frame and events in their limited areas. If they did, they would have done something by now. It would be a major show of force and help them obtain more support and funding for their cause. It would be all over the press. After all, what average citizen would disagree with getting rid of rolling megawatt interference generators ? It would actually show the Government doing something that they can relate to and find worthwhile. The bills that are now being submitted to Congress would not have been necessary if they knew how to head all of this off in the first place.

That is called living in a dream world.

>>> You can call it what you like. Why tempt fate ? It is like waving a steak in front of a dog. Sooner or later, no matter how fat and lazy that dog (or branch of the Government) has gotten, it will take the bait. I don't want to be around when that dog decides to bite. Why not post the "DX Directory" on a website so that others that weren't familiar with "who's who" can directly contact all the players in their local area ? That way they can try to join in on the fun also. That's the same logic that was used when it was stated that more "recruits" have shown up at events due to advertising on the net via websites.

I also find it somewhat funny that you never said anything about that in the past, but only choose to come out to chastise someone.

>>> I have never thought that it was wise advertising event dates or having "linear web sites" to the general public. I figured that it was not my place to tell someone what was wrong and right. I had hoped that common sense would prevail for all of our sakes. If folks were truly interested in attending a "get together" or locating specific products, they could easily find out via the grapevine. CB is strictly about communications and functions primarily by word of mouth. It is done both over the air and in person.

>>> I also did not "come out" to chastise anyone. I have not been on the puter much at all for quite some time. I simply could not sleep and decided to see what was up since i had not "visited" in a long while. While you may think that i only took the time to chastise you and your post, i sent out some other private responses via email to various folks here on the newsgroup also.

>>> I'm also sorry if you feel neglected or that i have blown you off. You are not alone. I have not kept in touch with TONS of people, and i'm sorry for that. Unfortunately, i don't have the free time that i used to have. I can not keep up with my workload and only seem to get farther behind as days go by. I do appreciate those of you that have continued to send me info and keep me "in the circle" even though i haven't been around.

>>> As it is Toll, I have tried to return some of your emails on occasion
and had every single one returned due to bounced addresses.

Have a nice day.

>>> I'm trying to. I hope that you do the same. Best wishes to you and
your family and all those others that i haven't chatted with in a while.
God Bless all of you and have a nice weekend. Sean

Hi, all!
I began in 1976..back in the "CB BOOM" days...
I was 15 years old, and kept bugging my mom for one.
(I betcha she regrets it ! :o))
It was a COBRA 85 , Dynascan AM 23 ch. base station.
We got it at a camera shop on Wood avenue in Linden , NJ.
(I live in Rahway/Clark).
I didn't have an antenna, but she bought me an 18 inch loaded whip that strapped directly to the back of the set, no coax. I got out about a mile on the first floor, but soon found myself spending hours up in the attic of our 3-story home, where I actually did my first "DX" contact, to the NEXT TOWN !
I still remember those days,as simple as they were, alot of joy came of it. CB was alot different back then. Everyone had great audio, alot of tube rigs were on the air back then. There wasn't the "echo-max, roger-beep" crap you hear out there now.
But in about 1977-78, you couldn't hear ANYTHING, unless real close...the skip was a ROAR, due to the sunspot cycle.
I still enjoy the hobby, I have 2 Tram D-201's, a Lafayette HB-25A, a 148 GTL, and a few other 'back-up' rigs. I am now 39, and still live in the same place with all the memories.
How about you? Please repond via this group, as i'm busy filling tube orders in my mailbox.
(of course your welcome, if tubes are needed, or you have a question)

All the Best!

Thank you,
Joe Pratt, Tubecntral@aol.com

2322. Re: Antenna question

Newsgroup: rec.radio.cb
Date: 1999-09-12 00:00:00 UTC
From: Sean <bigfoot1@megsinet.net>
Message-ID: <VAIC3.447$NW5.56555@news.corecomm.net>
Source record: 2322

Your suggestions and observations are true for all antennas. Raising the antennas' height lowers the chances for front end overload of tv's / stereo's and gets them above the telephone lines in most instances. On the other hand, if your suffering from feedline radiation you have now added more feedline to radiate from.

I did an installation of a Starduster for a younger friend of mine many years back. He had been running the same antenna with the hub located at appr. 35' above ground. The next door neighbor confronted him and told this teenager that he would "stuff his antenna up his ass if he bothered his tv just one more time". I reinstalled the antenna following the ARRL recommended installation procedures (multiple grounds, careful cable routing, etc). With the base of the antenna at 55', we did not bother a nearby TV running only a set of rabbit ears. Keep in mind that this was with a strong radio being used, not some bone stock gutless wonder. The irate neighbor never said a word after we had re-installed the system, so it obviously was working much better. The more efficient installation also benefited the operator, as he was now getting reports of S-9 with great audio at a distance of slightly over 20 miles away.

The only antenna that i have ever found that does not respond well to normal installation procedures is the infamous TVI machine, the A-99. We know why it has the problems that it does, but exacting the cure that works in all circumstances is another story. I know that many of you folks don't have problems with them and love them dearly, but you are more the exception than the norm in my experience. Sean

>Hello Bill: You would be better off with a Penetrator 500 a 5/8 wavelength
>antenna. A hole lot less neighbor interference problems, and it gets out
better.

Right. But make sure you have the Penetrator mounted high enough so the
base
(ground plane) is ABOVE neighboring TV antennas. Since this antenna is such
a
strong performer, it will cause TVI to antennas which are directly in line
with
it. I once had one on a 10' mast on the roof. Neighboring TV antennas were
also mounted at 5-10 feet above the roofline. My signal radiated right into
their antennas. Simply raising my antenna to 25 feet above the roofline
eliminated all interference problems AND caused me to get out and receive

better as well.

Can anyone point me to a link for schematics, owners manual or related info.
Got from a garage sale, it has a digi scan on top and covers 26-28 mhz ,
after fixing the signal light everything works fine, but I would like to
find out more info on this rig.

Thanx

To anyone that can help:

I'm new to the CB world. Just bought myself a Cobra CB mobile radio and I'm looking for advice on how to use it properly, that is, talking to others appropriately on the air waves. Does anyone know where I can find some good information on how to communicate properly with other CB users? I don't want to look like a fool when I start communicating with others on the CB channels.

Your help would be greatly appreciated, signed the handle: silver spirit!

2329. Re: So what was your FIRST RIG ?

Newsgroup: rec.radio.cb
Date: 1999-09-12 00:00:00 UTC
From: Dick Williams <hermit@erie.net>
Message-ID: <rInbN19xE9wx8YK8=pjLIG=vjcN9@4ax.com>
Source record: 2329

For me my intro to CB was about 40 years ago. Got interested in part from a neighbor - I still rember his call sign: 20Q2367 - probably not too many folks remember those numbers! I applied for an FCC license; call sign was: KJI1398. First radio was a Lafayette HE-20C. A five channel mobile/base radio as big as a mid-sized suitcase. It was chrystal controlled so you had to buy a specific chrystal for the specific channel you wanted. Back in those days EVERYBODY had a 102" whip. Belonged to a CB club in my area that helped a lot of people with broken down cars and other minor emergencies. It was a great time back then. Next radio was a 23 channel Motorola, then a Midland, Cobra, and now a Uniden PC66XL. Next radio will be the Uniden Grant LT.

Regards,

Dick

****For Sale***

I have a 102 whip for sale hardly used. I hit the under path on the highway with it. The antenna is bent in half but still works great. No one will even notice it. Since there is a bend in it I am open to offers. The bidding starts at $ 50.00 bucks or best offer. If interested let me know. This baby won't last long at this price.

It can be done but it is very tight inside an M6B. You will have to make sure the contact pins on the switches dont touch anything. I have had better luck in the 575
mic for this. do you need a wiring diagram on how to do it? I have one and how to wire it up on both ends.

I have already posted it.

And it is not a fantasy that hams want to have CB amplifier manufacturers busted any more or less than their own.

Hams want the CB bands cleaned up. I would like to see some of that happen.

However, things that harm nobody don't bother me, like you seem to fantasize about them doing all this damage...

Anyway, I have already posted the entire story, so go look it up if you want it. I refuse to do all your work for you.

Have a nice day!

OK, question is, we just received our long awaited texas star sweet 16...
we want to drive it with a Palomar TX-100...do we need a higher amp
alternator than the standard? anybody know? thanks for the response.

2343. CB radio for motorcycle usage

Newsgroup: rec.radio.cb
Date: 1999-09-12 00:00:00 UTC
From: jwgilmer@aol.com
Message-ID: <19990912100822.12751.00006109@ng-co1.aol.com>
Source record: 2343

I'm having some trouble finding a decent performing radio that can be used with a motorcycle. Most of the products on the market specifically for this application use handheld CB radios that aren't weatherproofed and are, frankly, butt ugly. Reportedly, according to a seller of communications equipment for motorcycles who does NOT recommend CB in general, when running a power source off of a motorcycle the electronic noise will be so severe as to make the radio useless.

One of the Honda (or similar) CBs that incorporate AM/FM radios is out of the question because of the large size of the radio, and it's specific packaging for a specific bike.

A friend gave me one of the weatherproofed Radio Shack radios (the standard one, not one of the handheld ones) and the size, weatherresistance, and styling seem fine but there's no external speaker jack.

Can anyone suggest a competent technician who can modify the existing Radio Shack radio, by installing a speak jack or speaker line and possibly some filtering to reduce the electronic noise if that becomes a problem??

As an alternative, does anyone have any practical experience installing a CB on a motorcycle??

2345. Re: CB ant : why 102"

Newsgroup: rec.radio.cb
Date: 1999-09-12 00:00:00 UTC
From: Timmins <timmins@penn.com>
Message-ID: <QIOC3.2531$JG2.14065@newsfeed.slurp.net>
Source record: 2345
Cross-posted to: rec.radio.amateur.antenna,rec.radio.cb

The figure of 108" IS correct- as a 1/4 wave at CB.....
the springs commonly used for these were 6" long- hence the 102" whip......

In (MANY) years past - both were advertised-
the 108" was for when you didn't want a spring- the 102" was for when you
did.....

One who remembers when........

Good idea, does this mean you will take the antenna? Now all I have to do
is find someone smart. Do you happen to know of anyone who is smart.

Message-ID: <eROC3.3394$C3.23214@insync>
Source record: 2347

Yes, you will need another alternator.

At the very least, a couple batteries would help, but to truly see the power from that amp, get another alternator, or replace the one currently in it.

> >>> What you state here is that all of the information that you denied
Pop
> Comm from using can already be found on your website (license plates,
> names, etc).

No, I am not. Are you familiar with any of the other sites that carry info on keydowns? I seem to think that CB Radio One has a page, as does Baby Blue, and tens to hundreds of them on the free pages. So, once again, I am not the only person doing it.

That means that you have already put these people at risk.

Show me, on my web page, that I show anyones name or license plate. Hell, I don't even show their handles, just to keep the anonymity up! For all anyone else knows, I take these pictures at a fundraiser for the NAACP!

> Another thing to think about is this: Do you actually believe that if the
> FCC confronted the "old school / old timer's" at Pop Comm that they would
> not reveal their source of info ?

Their source of info is revealed at the beginning of the article, where they say who wrote the article! Big mystery here!

From their, it goes on to say that if anyone would like any other information, they are more than welcome to talk to me about it.

I will bend when the FCC comes to my house, let me tell you... Let's look at the pure, raw facts.. I don't have a single CB radio, or piece of CB radio equipment in my shack. I run a completely "Ham Radio" station (as your friends that I have spoken to on occasion would attest to), so their is a lot their to leverage against me, isn't their?

My amplifiers, all Class AB, and all capable of legal limit as designed. Capable of more, but designed for legal limit. My "Ham" license class... Makes all of the amplifiers that I own legal.

I think you better go out and buy a copy of the magazine and see for yourself. Their is one entry in it that I didn't have any control over (and honestly didn't know it was going in) by another person that is a LOT more damaging than that I had contributed!

> >>> I have already been there and done that.

More people have than you think...

Why do you think that you
> never saw me pushing specific products or advertising items for sale ?

Because you are not an internet dealer? Do you honestly think that I would believe that you never sold anything over the internet? Did you know all the people that you sold to first-hand?

> Arguing technical points in a public forum and advertising something that
> the Government considers to be a criminal activity is another story.

So it is OK for you to advertise a criminal activity on a public forum, but not OK for me?

I thought only Bill Clinton believed in that kind of bullshit?

>
> >>> I have had "the boys" looking for me. This was long before i ran a
> shop and was doing radio work out of my house.

Then that is your own problem for not being discreet enough about your clientele!

At this time, Dennis and i
> were rivals and competing against each other for business. Even with the
> anomosity that existed between us as competitors, Dennis was alerted to
the
> fact that they were looking for me and was kind enough to let me know what
> was going on before anything went down. I would have done the same for
him.

That is called common courtesy, and I do believe your statements about Dennis.

> The "boys" are still around and DO pay visits on occasion. Those of us
that
> have been around know that any added attention is only a BAD thing.

You talk like I am someone new to this hobby? Sean, I was playing with the 3CX10,000 12 years ago. I am nothing new to this, and I have had "The Boys" at the house, at the shop, etc. I suggest if you are so scared about added attention, you stop posting to the newsgroup, stop having all your "Close down the shop, stand on the bench and tell everyone about the problems of just clipping the limiter" sessions in your shop, and stop advertising that you know what your doing!

I didn't see you very close lipped after Memphis last year and the work that we (Dennis, you and myself) did to Bobby's Suburban...! Or the Maywood break. Seems that's all you could talk about for a week or so!

What's good for the goose???.....

>
> >>> No, I honestly do not believe that the FCC was aware of any scheduled
> events.

You live in a fantasy world then. These have been going on for years (20 plus, in the case of some breaks) on both sides of the country!

Hell, some of the breaks (Like Hot Springs and Memphis, Tyler, and quite a few more) are actually sponsored by local government..! One of the competition pages (Midas Touch) has pictures of people on his page.... With their names and license plates..

Are you jumping his shit about it?

As everyone knows, these are typically held on Holiday weekends.

Point is?

> This puts most of the agents at home with their families barbeque'ing and
> caring less about their jobs.

No, real FCC enforcement personell (not the Washington beauracrats) are still out doing their job. Granted, less of them are doing it, but they are, and it is pretty funny of you to think that if a break has been happening for 20+ years that the FCC doesn't know about it.

Most normal people are out and about,
> enjoying their time off of work. Interference MAY NOT be noticed quite as
> much for those reasons.

Or, you could look at the other side that says

"More people are off work and at home enjoying their time to watch that soap opera that they haven't seen since the last holiday", or "More of the male members of our species are at home watching the 20 hour football marathon".

Thinking that just because it is on a weekend that nobody is home is stupid.. Especially here in the South, because it is so flippin miserable in the summer that MOST people stay home rather than go outside in the humidity!

>
> >>> Regional keydowns are also very infrequent (once a year) and they may
> not have noticed any specific patterns regarding time frame and events in
> their limited areas.

Sure. Same weekend for 20 years, same motel, etc., etc., etc. Real unnoticeable. That, and the same drivel that gets put out over channel 6... "And I hope to see you at the function come (insert holiday here)"! Or the rap songs that one of our greats has put out...

If they did, they would have done something by now.

Really? Are you now the scheduler for all FCC activity? I think that this is speculation on your part.

> It would be a major show of force and help them obtain more support and
> funding for their cause.

No, they would bust a bunch of people who would have to pay a minimal fine. May face vehicular siezure. That is about it. How much money would they get out of it? About as much as they get from a silent auction for spectrum that costs them not a dime!

What generates more cash flow??? Having to send agents somewhere, coordinate with local and federal law enforcement, or selling off spectrum that was free to them auction style, where it costs them nearly nothing to do so.

And the answer to that question will show you why the FCC has had their view skewed for so long.

It would be all over the press.

Locally... Yes.

They didn't say a thing on Channel 13 about the 15 or so busts the FCC made here in Houston in the last month or two..... Nor anything about the person who was busted for manufacturing.

Truth is, the majority of the general public could care less about the CB "problem" because the only people it is a problem for are the ones complaining.

So the FCC gets a million complaints a year (and this info is purely theoretical). What percentage of America is that? Pretty insignificant, huh?

After all, what
> average citizen would disagree with getting rid of rolling megawatt
> interference generators ?

Now, answer this question.... "How many average citizens would know what one was", or this one, "How many citizens would give a flying fuck when they can't send their kids to school because of fear of them getting killed, hooked on drugs, etc., etc., etc.". Seems like their is a lot more fears out their than of CB radio, and a lot of them are founded.

It would actually show the Government doing
> something that they can relate to and find worthwhile.

Who could relate to... 1/20th of the population of the United States?

And let's face it.. The majority of people in this world who are running big amps are not exactly "Prim and Proper".. What does this mean...

The live in areas of town not exactly considered "great", and the people complaining are not of the nature to go out and vote.

Granted, a lot of this happens in fluent neighborhoods, but I hear a lot more big stations coming out of the ghetto here in Houston than I do in the Suburbs!

Where are people more likely to give a shit?

The bills that are
> now being submitted to Congress would not have been necessary if they knew
> how to head all of this off in the first place.

Yes, fire the lazy fatcats in Washington and get someone like Hollingsworth 20 years ago.

Face it, what is happening is inevitable.

> >>> You can call it what you like. Why tempt fate ? It is like waving a
> steak in front of a dog. Sooner or later, no matter how fat and lazy that
> dog (or branch of the Government) has gotten, it will take the bait. I
> don't want to be around when that dog decides to bite. Why not post the
"DX
> Directory" on a website so that others that weren't familiar with "who's
> who" can directly contact all the players in their local area ?

We have been here before, and you and I made a united front to Brass and Rick of CB Radio One against doing that. As you see, it hasn't happened.

That way
> they can try to join in on the fun also. That's the same logic that was
> used when it was stated that more "recruits" have shown up at events due
to
> advertising on the net via websites.

And havent we learned from the ham hobby that closing the doors to a hobby is good for it?

Jeeze!

> >>> I have never thought that it was wise advertising event dates or
having
> "linear web sites" to the general public. I figured that it was not my
> place to tell someone what was wrong and right.

Only now you come out from your "coma" and choose to do so. Makes sense.

I had hoped that common
> sense would prevail for all of our sakes.

And for the most part, it has.

If folks were truly interested in
> attending a "get together" or locating specific products, they could
easily
> find out via the grapevine.

How do you figure? If everyone was as tight lipped as you seem to want us to be, nobody would talk about anything!

CB is strictly about communications and
> functions primarily by word of mouth. It is done both over the air and in
> person.

And the FCC never monitors anything over the air, does it? And people never talk about these functions over the air, do they?

Fantasy world comes to mind again.

>
> >>> I also did not "come out" to chastise anyone.

Could have fooled me. You make one post, and what is it doing? Maybe that was not your intention, but the simple fact of the matter is....."

I have not been on the
> puter much at all for quite some time.

Noted.

I simply could not sleep and decided
> to see what was up since i had not "visited" in a long while.

As you can see, it has gone to hell.

While you may
> think that i only took the time to chastise you and your post, i sent out
> some other private responses via email to various folks here on the
> newsgroup also.
>
>
> >>> I'm also sorry if you feel neglected or that i have blown you off.

Neglected.. No. Blown off... Yes.

When I come to Chicago 5 times in 5 months and attempt to get in touch with the locals, yes, I feel blown off. Even other people in the area said that they could not see why you where "Blowing me off".

Acts speak louder than words, but I will give you the benifit of the doubt. I am sure that their are people on the group who believe the same about me, but I make it a point, if someone from the radio or a newsgroup that I frequent comes into my town, I at least stop in and say hi, if not take them out to lunch.

> You are not alone. I have not kept in touch with TONS of people, and i'm
> sorry for that. Unfortunately, i don't have the free time that i used to

>illegally blow someone elses stuff up! That would be criminal behavior,
>falling under malicious intent.

Negatory, good buddy. I was engaged in a legal conversation, using a type-accepted transceiver, and running legal power. The station I was communicating with at the time just happened to be in the same direction as my neighbor's living room. So of course, I orientated my antenna accordingly. It's a darn shame they don't put better RF shielding into expensive products like home organs.

A BIG 10-4 ON THAT! If we ignore them + these sex stuff on the other newsgroups they will like CB RADIO today will slowly go a way! Someday CB & these newsgroups may be free of these people. I am wondering if these people like doing it for attrition & they want people to respond so they can have a audience. Just like CB RADIO, it seems like these people love acting negative & racest on the air + doing things on these newsgroups. Well if they do not stop I think that the ISP's will someday log them off for good!

You can use an isolator and devote an extra battery
or two to the main amp. However, due to the lower
supply voltage, the amp won't put out as much power
as it would if you were to do it with an extra alter-
nator.

2375. More remembering.....

Newsgroup: rec.radio.cb
Date: 1999-09-12 00:00:00 UTC
From: David Patterson <davidp@mindspring.com>
Message-ID: <37DBED9D.75A5@mindspring.com>
Source record: 2375

I got started in CB way back in 1961, in the summer between 10th and 11 grade in high school. I was working part-time as a photographer for my hometown newspaper in Marietta, Ga, just north of Atlanta. There were 7 or 8 of us who covered HS football games every friday night. All of us had CB radios in our cars. We would all meet back at the newspaper office after the games to develop and print our pictures.

There were 7 or 8 high schools scattered around Cobb County, which is maybe 20 by 30 miles in size. As the games ended and we got in our cars to make the trip back to the paper, we could all talk to each other, even from one end of the county to the other! I don't believe that the signal could make that trip today, and I'm not sure why it made the trip so well back then. Maybe it was the lack of other traffic on the channels, maybe it was because we all had 102" whips, maybe it was the great old tube radios.

I can't even remember the type of radio I had first......I do remember it was a six channel radio with plug-in crystals. My next was a Lafayette 23 channel, and then a Motorola 23 channel. The Motorola was the best sounding cb radio I have ever heard.

I have been away from the hobby for many years. I have ventured back hesitatingly lately. The language on channel is distressing. I am certainly no prude, and I have been known to use locker room language quite well myself.....but in the proper place and at the proper time..and on the radio is NEVER the proper place.

I have recently put a cb in my car, but I really have to use it mainly when I am travelling alone. I hate to have my family in the car when some of these half-raised idiots start using language that would make a sailor blush.

Anyway.....I'm rambling now....I just wanted to share a bit of what I remember from those early days of the hobby.

I have heard all about this. The problem is that out of say 1000
drivers down there who have say $10,000 on thier person, maybe 1 is a
dumb paranoid person and the other 999 are transporting their drug
money from their latest drop. So, since our country is such a free
place (thank goodness), we either have a bunch of drug runners who
have free rein to make millions of dollars, or we can let law
enforcement trample on citizens rights. I say legalize drugs. This
is the only way to eliminate this problem.

Hmm, maybe your FRS radio will trigger some sort of military warning system which will then declare war on Germany. Watch out for the Saab fighter jets which will be arriving at your location soon.

These types of antenna's are sort of a permenant mount situation. Why
don't you get a cellular look-a-like mag mount. It'll only get you
out about a mile or two but should be adequate for highway use if
thats all your interested in. Their small to, and will fit into a
suitcase.

Just keep listening. Then, when you feel you've got something to say,
just break in and say it....

Be curtious to other users though, no matter how much another operator
might irritate you. If you are so irritated with an operator that you
feel like you might want to cuss or try to irritate him back, just
turn off the radio for awhile.

in 1977, i lived in georgia for 6 months.
there were few people in my area that could read their own names let alone road signs. they had cassette tape players in the DMV to read the questions and give multi-choice answers. if the person couldn't count 1-2-3 or 4, they had an examiner read the questions and answers.
here in florida, the examiners read the questions. the other responder mentioned the different shapes and colors of signs.
this is the reason for the shapes and colors.
this is not to put down truck drivers but if you took a poll, you would probably find a good percentage of those that cant read either.
an other example would be the tourist or business person from a non-english speaking part of europe in posesion of an international drivers license. they can be obtained at an embasy or even AAA.
just some info.

That is US law. Not just Florida.

And if you can pass a test that says you can drive, then you can do it.
Whether or not you know what the words on the sign mean pays no difference,
as long as you know that the red octagonal sign means stop, and the upside
down yellow sign means yield... It makes no difference what they say.

And now you change the story.

Sorry, in the original statement you made, it led the jury to believe that you had malicious intent (said I better "do something about it." So I did. I pointed my Moonraker 4 directly at his living room and cranked up the D-104.)

There would have been no reason for you to crank up the D-104 to make a conversation, and if you wouldn't have been running an illegally modified radio, the only thing that the "opened up" D-104 would have done is bring in more background noise, because the limiter would have clipped anything greater than 100 percent modulation anyway.

Sorry, but you have lost the pedestal you fakely stood upon.

You are no better than the guy running 70K because you have commited the same felony (running excess power and running over 100 percent modulation, which let you run the excess power in the first place) that they have.

Maybe to a lesser degree, but you did the same thing.

Have a nice day, two face.

Just because you can't read doesn't mean that you can't memorize.

Hell, Monkeys in labs can't read, but they can memorize.

So can lab rats, Dolphins, etc.

Don't try that tactic, 'cause it just don't work.

<<As the games ended and we got in our cars
to make the trip back to the paper, we could all talk to each other,
even from one end of the county to the other! I don't believe that the
signal could make that trip today, and I'm not sure why it made the trip
so well back then>>

Yes, big ole tube radios and 108" whips mounted on big ole Detroit iron
American cars. Reason you got such good range was there were no other
signals on the band at the time! (1960's)

<<Anyway.....I'm rambling now....I just wanted to share a bit of what I
remember from those early days of the hobby.>>

Not rambling at all. Many people don't realize how REALLY great CB
was at one time.

The outlaws will get a good laugh out of this, I'm sure: when I was
14 or so I was in an Explorer Post and our 'specialty' was communications.
A few in our group had cars and drivers licenses. Big tube CB radios
were mounted under the dashboards. We used them to coordinate
operations at Boy Scout camporees and such. Off the air, our language
was what you'd expect from rowdy teenaged boys. But on the air we
were clean and by the book. We took the FCC CB license very seriously in
those days and didn't want to lose our 'privileges'.

What is everyone's opinion on this radio ? Does it have any mods and what
can I expect for output after it is "tuned" ?
I am used to 2950s and need a lower priced radio for the "beater " truck am
I going to be really depressed at the performance ?
Thanks A million,
Tinker

I too am interested in a CB for my bike. There was a communicator comparison in Motorcycle Consumer News in the Nov. and Dec. issues. The only CB units were a J&M radio that was expensive and they didn't like, and a HJC 27-A. Their first HJC unit had a problem with noise in the speakers when the PTT button was pushed. In the next issue, they said HJC had fixed this. It comes in it's own tank bag, and has a handle bar remote control for volume, squelch, channel, and PTT button. It has a range of about 1.5 miles. A little expensive at just $400 list price. If anyone has any more info on this or any other motorcycle radios I would appreciate it.

From: Oris <oris@dirtball.com>
Message-ID: <37DC5BD4.56EC50DD@dirtball.com>
Source record: 2477

Great mobile or starter rig! I have an ICOM 740 HF mobile that I would like to sale or trade. I'll Take 300.00 cash plus shipping thatï¿½s about 25.00 give or take. I trade It for a Pentium 233 socket 7(I will consider any other Intel Pentium
Computers above 120 MHz) with at least 2 gig hard drive and 32 Megs of ram, 56K V.90 modem,(I will consider 33.6 and 1 gig harddrive) Keyboard

Mouse and 13in svga monitor. Or I will take a 2-meter all mode base rig Digital readout. Tell me what you have to offer for this HF rig.
The ICOM 740 is the stock IC-740 it has no power supply it runs Strictly 12 volts DC. The rig is in good clean shape and I don't smoke and the guy that had it before me doesn't smoke. I was the third owner. I ran the rig in the mobile. The rig covers all the ham bands. It Doesnï¿½t have a continuous coverage receiver. The rig has both sidebands

CW
And RTTY as far as modes. Its dimensions are 111mm (H) x 286mm (W) x 374mm (D). Itï¿½s rated at 200 watts input. I will include stock mic and instruction manual.
Drop me a line and make offer
73 from Oris

10-200 is on there, Also why do the #'s split when the 10 codes were made? I mean don't they know how to count? What ever happen to;

1
2
3
4
5
6
7
8
9
10
11
12
13
14
15
16
17
18
19
20 & so on or is there a set 10 code list that goes to 1000 & they devide it up?

Then the kids do not know how to use the radio so they act like they do &
mess it up for others. Just think if things were passed down from when we
were kids & how we were taught. Why are the young adults or teenagers so
nasty & have attitudes these days? We all should get together & form a group
then start something to get the FCC back 10-8 again. Right now ever since
1998 to now most Channels around the MD STATE are dead & maybe what is
needed is a change from;

cussing/name calling/music playing

to this;

cussing/name calling

to;

cussing

to now;
```

clean

Then on 01-01-00;

~BREAK CHANNEL, This is CB KING = KBDA-7796 10-8~

~Break Channel for CB KING got a copy on <your handle>?~

& there can be a few ways to have clubs., check-in's;

ON AIR
ON INTERNET (There are a lot of sites forming now & I already am almost done on 1 of my sites & I plain to have a few so if someone did a search on the internet;

SEARCH FOR [ ] GO

SEARCH FOR [KCBRN] GO

SEARCH FOUND 10 MATCHES WITH KCRN

KCBRN.....GOOD LEGAL CB OPERATIONS

Never have heard a youngster so far on CB in my area :(. To be frank, only activity I hear is on
centralized on 27.025, and it's cranked to the max concerning power :(. I agree, let's clean up CB for a change, but how?

2433. Yet another antenna question

Newsgroup: rec.radio.cb
Date: 1999-09-12 00:00:00 UTC

Message-ID: <xrZC3.1592$34.188859@news.oh.voyager.net>
Source record: 2483

OK I am new to CBs so bear with me. The radio I am using is a Radio Shack TRC-421A I found in a traded in car at the dealer I work at. It looks old and tired, but seems to work OK. My problem is my car is a 94 Camaro convertible. The only metal panels on the car are the hood and the rear quarter panels. The antenna I am now using is a Radio Shack no ground antenna that came with a glass mount I replaced with a mount that bolts to the rear plastic panel between the trunk lid and bumper. My current swr readings are 3.1 on channel 1, 1.7 on channel 19, and 1.1 on channel 40. The radio only has a range of about one mile usually, but I did hear a guy parked in a parking lot about 3 miles away once, though he could not hear me or just didn't respond. I would like to get more range, but don't know what type of antenna would work on this plastic car. The car does have a trailer hitch under the bumper that I've thought of trying to mount a steel whip onto a removable bracket when I'm not going to use the radio. I would like to get a better radio, but I want to get this antenna thing figured out first. Any help would be greatly appreciated.

Hmmm, when you called to complain you must have done so intelligently,
politely, and with a certain amount of respect. In other words, you treated
them like decent human beings, and you got a free phone in the deal, even
though the station technically didn't have to do that. Does anyone else out
there see a life lesson in this?

If the ham can show that his harmonics are at least 40dB below main
signal strength at 30MHz and below, 60dB below main signal strength at 30
through 225 MHz and that he is not exceeding maximum signal strength at the
transmitting frequency, then the ham's act is as clean as it needs to be, no
matter what frequencies his harmonics fall on.

Right. This is along the lines of what I'm considering. In fact, I might go with a Little Wil for this.

> ... are some sites that are worth a visit to see what they can set you

I've done business with Bill's before with antennas and CBs. Haven't found a better vendor than him.

>
> AS WITH ANY ANTENNA...
>
> Location is important! I can't stress this enough. An antenna on the
> Roof of the car is going to perform better than an antenna on the

Yup. Got that covered. I've got a tiny Tercel that I've got a Wilson 1000 Mag mount smack on the roof. Got a nice, flat 1.5 SWR on all 40 coupled with a Uniden 76XLW and a Road-Devil Astatic Mic. The car looks ridiculous with that huge antenna on it, so I also answer to a handle some driver dubbed me in Connecticut..'The Deskspike' :)

Of course, it looked more ridiculous when I had the mid-shafted Super-Penetrator antenna up top. :)

> Mag mount antennas are great for stowaway, but they do have a VERY
> STRONG MAGNET, than can ruin tapes, diskettes, goof up calculators,
> even magnetize or stick to things you wouldn't expect.

I've got this big military duffel that I'd be stashing it in, covered with a bunch of clothes and whatnots that will be checked baggage. The Little-Wil's magbase isn't hugely powerful so I'm not too worried about that.

> This will also help you in Airport Terminals where sensors are used to
> detect weapons. Ferrous materials set these things off, so a keeper on
> the magnet is recommended to keep the rest of the stuff in your bag
> from "Adhering" embarassingly to the magnet during a search.

chuckle I'm not going to worry about that too much, but the Wilson antenna mag-mounts usually come with a washer/protector.

For $22, I think its my best option with the performance it gives. A buddy of mine has one on his truck (he's got a height limitation for his vehicle) and has nearly a undetectable SWR (<1.3 on all 40) and has excellent results with it.

Thanks for the advice!

> suitcase.

I tried one of those once. I forget the model, but I got it at Radio Shack. It was my first antenna. 28" long or so, I could barely get a SWR of 2.0 and I could barely communicate with a fellow more than 1/2 mile ahead of me.

For $30, I felt really ripped off. I'm impressed you can get a mile or two out of these. I was curious if the Midland variety, which appears to be center loaded, had better performance.

The Radio Shack one I had was held on by a magnet through the glass, not adhesive.. Hmmm.. I'm glad I know this now, its not an option for a rental car.

For $8 less, I can get a Little-Wil and get better performance.

Thanks for the reply!

Bonjour,

j'ai depuis 3 jours une panne sur mon poste CB. En effet, j'entend et cela uniquement quand il y a une station qui module un enorme grattement, et quand il n'y a pas de bruit sur la fr�quence il n'y a pas de grattement !
Et ce grattement ce fait aussi dans ma propre modulation quand je suis en TX.

Apr�s un long delais, la panne disparait... mais le delais devient de plus en plus long....

Le bruit ressemble � un micro pr�ambli trop pouss� o� il y a une sorte d'effet d'arsen...ou encore a un mauvais contacte de cable micro...Vous voyez le genre.
Je n'ai aucun probleme de cable micro, ni de tos, ni de faux contactes dans mes connecteurs.

Je possede un 2eme lincoln, et l� pas de probleme.
Merci de votre aide

My first radio was a Fannon/Courier Fanfare 880, God how could I remember that and it was purchased from the now defunct Two Guy's Store in Woodbridge, NJ for what I believe was $189.00, 1975 dollars. Other radios which there were many, that I had the privilege to own was Johnson Viking, believe the model was 4123 but the 23 CH SSB version purchased from Mark Radio, Fords, NJ and later my first "big rig" a SBE Console II which I worked my butt off for sometime in 1977? .. It's amazing how we can recall things like that, for crying out loud still can remember the D104 wiring code for that radio!

2456. Strange buzzing noise.

Newsgroup: rec.radio.cb
Date: 1999-09-13 00:00:00 UTC
From: Barry <x123x1234@yahoo.com>
Message-ID: <Bz6D3.30236$kL1.331122@news2.rdc1.on.home.com>
Source record: 2420

Lately I have been receiving a "buzzing" interference on AM it's the worst
on channel 15. The radio is a Madison and the antenna is a A-99.
The interference is also present on my mobile unit when I am near my house.
The sound is like the noise you hear coming from high voltage panels. When
the antenna is removed from base the interference goes away. The
interference is also not steady, It will go away for a hour or so then come
right back. The only frequencies that I hear the interference is on the
normal 40 channel range USB or LSB with the worst being
8 - 25. The rest seems fine.

Any suggestions would be greatly appreciated!!

Barry

What are you trying to say?

Family Radio Service was started a long time ago (Early 80's,
maybe late 70's, like 1979?) and uses 460 Mhz. First units I
saw were mobile units from Motorola...

First CBs transmitted on 27 Mhz, since created (mid 60's - just
a guess).

I aint no Cb "genius" either, but I have been around the hobby for
quite a while - I can remember when there were several CB
magazines, but S9 was the best... BTW, is Tom "Tomcat"
Keitel still around?

My first radio was a 23 channel HT, seemed like the most flexible
radio (I was 11 at the time), then got a TRC-55 23 Channel base
(nice looking), then worked my way through several SSB mobiles,
wound up with a President Madison SSB base, then computers
took over my free time.

My most interesting DX was from Walnut Creek, CA to somewhere
in NJ running 12 Watts (stock) into a handmade quarter-wave dipole
hanging from the eave outside my bedroom window. It was on HF,
and it was a rush! This was during the day - damn, sunspots are fun!
I think the radio was a Cobra 132 (XL?), 40 Channel, 858 chassis...

Anybody know what this amp can handle?
<<<<<<<<<<<<<<<<<<<<>>>>>>>>>>>
A texas star Mod V is perfect for it. No more than 3 watt carrier and 50-60 watts of modulation swing. It will do it's thing with 50 watts of modulation drive.

Source record: 2427

Hmmm...how do you convert a "glass mount" antenna to anything else? The swr you mentioned dictates that the antenna may be a little short, since you get a good reading on ch 40 and high on ch 1. If possible you can try lengthining the antena and tuning for the middle of the band. Lastly, I use a radio shack trunk lid mount antenna on my Saturn, which is plastic except for the trunk lid, roof and hood and I have an swr below 1:5:1 across the cb band. Also, check the output with a watt meter to make sure your getting the full 4 watts out. Really, talking 3 miles in a city environment between mobiles, with even 4 watts ou,t is pushing it.

Good Luck!

Ron

Well, when posters from those countries enter the fray, condemning the freedoms we hold dear in this country and advocating their curtailment, and also resorting to personal attacks, then it begs for rebuttal and response over the same wide forum. Just like with the "Are all scanner owners the crimal type?" thread, there's always someone eager to condemn our system, then turn around and complain when someone responds.

i read an article a while back about those new wireless phone jacks.
the ones that you plug a base into a wall socket and the phone line and then
anywhere you want a phone, just plug in a remote unit into another socket and
then a phone.
they work on carrier current and are full of harmonics.
the article said this one ham had problems all over the spectrum and the signal
carried over the outside power lines for quite some distance.
the unit was in his neighbors house.
if you don't have one, ask your neighbors. there may lie your problem.
good luck
jeff

although i'm not in love with glass mount antennas, you seem to be stuck with it on a plastic car.
i'm told that the rad shack glasss mounts have a tuning screw on the inside piece that has the coax connected to it.
i don't see much problem with the mounting setup as you do get a good swr somewhere on the band.
another responder said to lengthen the antenna.
if the adjustment screw doesn't get you where you want to be, there should be a small allen screw at the base of the mast.
loosen the screw a little bit and move the mast up ONLY about 1/8 of an inch at a time. short antennas are very touchy when it comes to mast adjustments.
good luck
jeff

A bit of CB History,

UHF Citizen's radio initially started out in the 462 and 465Mc (note not MHz then!) range. That which was later "Class B" CB later became GMRS.

That which we now commonly refer to as "CB", the present 27MHz service, was added later at the expense of the 11 meter Amateur allocation which was quite honestly not being used to any great potential. It did support some experimental modes that were not allowed elsewhere (ie: slow scan television)

The "Family Radio Service" was the brainchild of Tandy Electronics dba Radio Shack, and has only been an established radio service for the last 2 or three years. All they did was take the interstitial frequencies that were between the GMRS channels and create a Part 15 type service.

Until FRS was created, these frequencies could be used for low-power (1 or 2 watt) simplex-only operation by licensed GMRS users. Of course, this required the application for a license and the requisite fees, so was not an option for most folks. These were the radios you probably saw from Motorola. The Big M was not in the FRS running until Tandy got the OK on it's RM from the FCC to create FRS.

To it's credit, I have seen LOTS of FRS radios showing up where I didn't think it would ever really take off. Along Highway 127 from Alabama to Kentucky, they have the "400 Mile Flea Market", part of which runs through my hometown of Dunlap, TN. I must have seen 15 or 20 folks carrying various versions of FRS radios while they were scouring the tables of stuff. I have also seen a lot of them at the local Fall Creek Falls State Park, carried by kids and adults alike.

Looks like a winner to me.

Serious Showing of Age here...

Dad and his co-owner of a Sunoco gas station got CB's in 1962. I was 7 then. Dad's first two radios were an old LaFayette HA-45 for the mobile and a Heathkit "Benton Harbor Lunchbox" for the house. Only 1 transmit channel! Dad later built an external crystal box for it adding 8 channels. Big time stuff then!

We later "upgraded" to Sonar Model G's, which had 8 crystal controlled transmit channels but continuous tunable transmit.

My "own" first radio was a walkie-talkie kit from LaFayette...100mw on channel 14.You can't talk 100 yards with that power on 14 anymore, but back then, I could talk to the daughters (!!) of my Dad's friend across town, perhaps 4 miles, with consistent reliability.

I have since gone thru many different rigs, almost all of them with SSB, but a few AM only for running I-75 with.

YES IT IS!!!
what if you had a texas star on your UN-MODIFIED pres. 2510 and a cop pulled YOU over and took it away with the excuse that it was illegal?
shoe on the other foot, you would scream about your rights as a legal ham operator.
i NEVER questioned the rights of hams to run power.
i question the authorities right to send out untrained officers to do the fcc's job.
in larger cities with big budgets, they will more likely train some people but in smaller towns, there's going to be "pros" who don't know an illegal setup from a hot water heater.

I agree on your concerns about untrained police personnel confiscating equipment. It shouldn't be allowed anymore than FCC personnel should be allowed to confiscate firearms.

On the other hand, I don't think there is too much concern with Hams "running power". We are allowed up to 1.5KW anyway on most allocations, and most Hams know that even that is a pretty heavy hammer to drop when 100 watts is almost always sufficient for loud-and-clear comms on a world-wide scope.

To troubleshoot stereo equipment, look at the speaker wires, I heard of a fella woho was having problems with a Ham operator coming in on his stereo, well turns out that his speaker wires were the right length to resonate at Ham bands, and were acting as an antenna, making them shorter took out the interference, also using coaxial speaker wires also solved the problem... The cable company is just pissed because if they have a 'leak' from the coax they can be fined for each leak and every day that it is not fixed. Here locally we had some 'leaks' from the cable company and it was reported by the Ham's that they were leaking on, cable companies use RF frequencies, but these frequencies aren't allowed (licensed) in free air space, so if they leak then it is the cable companies fault. The cable company here had to replace several sections of their cable because of a break in the shield on the coax. 73's Mack

Is there any type of device that can be used to "track" the interference?
With my mobile I have been able to determine that the interference is
limited to my street and approx. 50 yard radius. The only work I have
noticed is the local Hydro fixing a under ground line or something at the
guys house across the street.

I have had the I-Max 2000 now for about 1 yr and does very well. Im sure its about the same as the Max-99 (which Im going to check on), just a bit longer. Very good design and water tight so far, which water is the main demolisher of the internal copper parts/coils. Solarcon makes a good antenna for the impressive price, heh, its affordable.

You don't go back far enough, son. This was the mid-70s. 1976, to be exact.
Back before 40 channel radios. The FCC regulation which made limiters
mandatory was only applicable to the 40-channel radios. These were not legally
available for sale until January 1, 1977. The radio in question here was an
SBE Console Two. 23-channel SSB base with no limiter. If you've ever heard
one of these, they are extremely strong modulators, especially when mated with
an Astatic D-104.

>Sorry, but you have lost the pedestal you fakely stood upon.

(See above)

>You are no better than the guy running 70K because you have commited the

Tell it to the FCC. I committed no crime with my actions. On the other hand,
me thinks those 70KW mobiles are going to find some new company in the form of
Uncle Charlie now that their activities have been publicized and glorified in a
major communications magazine.

I have never mentioned anything about getting a ham ticket. Ham and CB are two completely different hobbies. Just because you like one does not mean you will enjoy the other. The belief that all CBers should eventually "upgrade" to ham radio is ludicrous.

Again, I am not anti-CB nor anti-ham. I am anti-ILLEGAL operator, plenty of which abound in BOTH services.

I was experienceing horrible interference from a local AM transmitter.
They are assigned a frequency of 1410 KHz. I was picking them up horribly on
the signal cable that I use on my 2-meter rig. Did some a little bit of math,
turned on the HF rig and tuned into 7.05 MHz on it while tuning to 1410 KHz on
my AM radio. Guess what I found. Same transmission (football game) on both
stations! Why did I pick them up on 7.05 MHz? It's the fifth order harmonic
of 1410 KHz (1.41 x 5 = 7.05)! They were coming in S9 from about a mile away!
I could actually measure the signal with a senstive voltmeter (was on the
order of millivolts). Took that piece of information to the radio station an
the engineer demonstrated to my satisfaction that his spurious emmissions on
first through fourth order harmonics was at least 50dB below his main signal
strength, which was 50,000 watts. That means that his spurious output signal
at any harmonic could be as high as .05 watt, and he's STILL be legal! To
make the problem worse, the reason I was experiencing such interferece was
that the leg of my 80 meter dipole that was connected to shield and the shield
of the feedline attached to that antenna and running into my shack was almost
exactly 1/4 wavelength of the offending station's assigned frequency. My own
antenna system was receiving the harmonic and then sympathetically
retransmitting their signal into my own equipment!
A couple of changes here and there, and the problem was solved. I
came away from the radio station with proof that they were indeed operating
cleanly, about 6 feet of copper grounding strap and a bunch of 6 guage
stranded copper wire. I'm able to operate packet with significantly less
interference and everyone's happy. They still get into my telephone ATAD, but
not so bad that I can't understand messages on the machine so I let it be, but
a couple of choke ferrites should fix that. Point the story? It's usually
the responsibilit of the interfered with station to reduce the impact of the
interference. Just like it says on the FCC label on nearly every electronic
component.

Wow, I guess its a good thing that most Hams know this. Due to this revelation I'm assuming both the Alpha, and the Henry amplifier companies will soon be out of business because no Ham would ever use the 3-10K watts of output that that these amps are capable of.....

Time to sell my company stock while the "gettin is good".

The reason that hams do not run obscene amounts of power is because they
are just trying to communicate, not run so much power as to keep others
from doing so.

My first introduction to CB was when a friend in Jr. High about 7 years ago brought a CB Handheld 40 Channel Radioshack with telescopic antenna. I thought it was so cool, even though he didn't make any contact. This was a private boarding Jr. High, so in the evenings there wasn't much stuff to do besides study. My best friend and I purchased the one channel cb's at radio shack (handheld) and would talk to each other after lights out. I thought it was pretty neat. Eventually him and I graduated, and went our seperate ways for high school. Then I mustered up some money as a Freshman in high school and purchased a 40 Channel Handheld from Radioshack with telescopic antenna. I would go outside of the house in the summer evenings and get on top of the roof to get out as far as possible. Mind you, I had to carry around mosquito repellant. After about a week of meeting new friends on the CB they called me Portable since I didn't have a handle. Ever since then my interest in radio has grown. I'm now studying as an Electronics Engineer, and have collected more cb's than I need. That's probably why I'm trying to sell them. CB is a great hobby. I might even try and become a hammy, but I'll always be true to CB, because it's fun, and it's ruthless. :)

I also get a buzzing across all channels at night sometimes. Pretty bad too...a constant 8 pounds on the meter. It'll usually last a coupla hours, then go away, though it does not happen every night. Haven't tested the range of this yet with my handheld...

I have a sneaking suspicion it's one of my neighbors turning on some noisy electrical appliance somewhere (hairdryer?) but don't know how to find out for sure...

Is there a site where I could look up reviews for handheld CB's?

Interested in a Uniden Pro 350XL or similar unit with scan and weather capabilities
to use on a motorcycle. Anyone had experience with that? What can I expect with a handheld vs. dash mount conventional rig - I realize the handheld will probably not do as well overall, but considering size, mounting/antenna considerations, is a handheld even worth considering?

The interference could be coming from a number of different sources. For starters, try turning off all power to your own home at the main panel for a few minutes and using your mobile, see if the hum goes away. At least that will tell you if the problem is on your own property. If that doesn't resolve the issue, use your mobile in the neighborhood and see if you have to turn up the squelch at some point. This would indicate that the signal is stronger. Electrical transformers are notorious for this sort of thing but they are usually pretty consistant day and night, or just at peak times such as afternoons with high air conditioner usage. If you can, use a very short piece of wire as a directional antenna. Connect a length of coax from the mobile to the wire (short, maybe a foot long). Stand outside the vehicle, hold it in front of you, horizontally, using your body as a shield, and turn slowly and try to get a direction on the signal. Your body will tend to act as a shield so it prevents a front to back signal strength question. Be aware that with a number of structures near you, the signal might bounce off and give you a false reading, so once you have a direction on the signal, move some distance and try again and triangulate the signal source. You might find it comes from two or more places--the result of the reflection off buildings.

I'm working on this, too.

Check out http://www.soundradio.com/listrad.html#headset

They have helmet speaker/microphone combos with a handlebar mounted PTT switch that will plug into a handheld CB, which they also sell. Unlike a lot of the helmet speaker/mic suppliers, these don't cost an arm and a leg - looks to me like you could put together a setup for not a lot more than $100, which is pretty much my price theshold for trying things out. You definitely get what you pay for, but I can't see spending a fortune on a J&M system then figuring out that it doesn't work all that well, you don't like it, don't need it or whatever.

What I'm trying to figure out is:

Is it worth trying out a handheld CB or should I just build a system using a conventional 'dashmount' unit in the tankbag. This is an option, since I already have a Uniden Pro 510 that I could use as a test mule. Don't know much about handheld CB's, but I'm a little suspicious of them vs. a regular unit. The little Uniden is probably as small or smaller than most of the handhelds and is a known quantity in reception and transmission quality. I'm not too worried about remote controlling the volume or channel - probably just leave it in one place and not worry about it.

Antenna - a big question, since a 'no ground plane' antenna either has yards of coax that can't be cut or is a funky looking kinda thing (you can see a picture of the Wilson model at Bill's 2 Way - it's pretty odd looking). Could mount a 2' or 3' fiberglas antenna on a fairly large (10" by 16") flat sheet of aluminum on the tail rack and then tie down the camping goodies on that, thus providing some ground plane for the antenna to use, but I don't know how effective that would be. I don't know what the Gold Wing set uses for ground plane when they have a 4' Firestik mounted on the bike, but it must sorta work, right?

No interest of any kind in Sound Radio, by the way; I just stumbled across their website last night and found good prices. Anyone tried their stuff?

I live in Worcester, MA, and thought this guy only could be heard in my area, since he always seems to be out there.

I traveled all around New England this past weekend and could hear the guy almost anywhere (Cherokee CM10 mobile with 102" whip).

If you know who I mean, post and let everyone know so maybe we can track down this weirdo. It is a person who has a high-pitched "sissy" voice trying to sound like a gay man, and he always calls people "silly goose" and sometimes yells at people for swearing. Once in a while he'll call someone a "fucker" but that is the worst he gets. I get him the strongest probably anywhere on I-290 from Marlborough to Auburn, but he fades in and out no matter where I am.

Anyone else hear this guy?

> 4 watts ou,t is pushing it.
>
> Good Luck!
>
> Ron

I disagree,a stock radio and good antenna should be good for 10 miles
or better consistantly,you might want to get a better antenna or at
least check yours with a field strength meter,SWR isn't all that
important when it comes to gettin' out,a dummy load has a great SWR.

Put a 102" whip on the hitch and make sure the hitch is well grounded to the frame,also ground the hood,trunk,engine,trans,etc.,all to the frame.
The antenna you have now needs to be lengthened slightly to bring the ratio down on channel 1.

Try a handheld CB with the antenna shielded by your body(against you chest)then when you get a full scale reading take the antenna off to get closer.

You are not even giving the results of your tests properly,the 2nd # in the ratio will always be smaller and is almost always 1,examples: 1.6:1,2.1:1.3:1,etc.
Read the instructions for your meter and then see if you still have a problem.

I've been reading this thread with interest...
so let me get this straight, what you all
are saying is that an increase in voltage,
while it may cause saturation, is capable
of substantially increasing output. Very
interesting. We have a standard 12v
battery in our mobile with a 130amp
alternator. To increase the drive to the
amplifier to 18-20 volts, what exactly
needs to be done....just install a new
regulator that is controlled externally,
ot does something else need to be done?

From: Toll Free <tollfree@bigradios.com>
Message-ID: <6SeD3.3733$C3.26957@insync>
Source record: 2546

The first thing that needs to be done is make sure that the amplifier can take the higher voltage!

Then, you need to have an electric (read that as charging system) that can take the higher volts. Some batteries can take 15 or so volts on them, most cannot.

Then, lastly, yes, you replace the regulator with another. Presto-Lite makes some good ones, as does Ford.

The most inexpensive way to get a regulator that is variable is buy a Ford aftermarket external regulator (about 15 bucks). Drill the rivets out. Adjust the voltage via the internal potentiometer.

Hope this helps, and use at your own risk. Yes, volting does SIGNIFICANTLY increase the output of your amp.

2547. Which antenna?

Newsgroup: rec.radio.cb
Date: 1999-09-13 00:00:00 UTC
From: John Callaci <Jcallaci@tnl-online.com>
Message-ID: <37DD8084.35857360@tnl-online.com>

Now I'm confused... I just called my local radio shop about installing a Wilson 1000 hard mounted on the roof of my Dodge Ram truck. They told me that the metal was to thick and the headliner ti close to the roof so they recommended a Antenex ? 600 series.

Any clues... Do appreciate the info. I was set on the mag mount Wilson then convinced myself to get a permanent unit.... now this.

Thanks for the help

John

Are you saying that most car batteries
CANNOT handle 20 volts then? Is there
a single battery do you know that is capable of handling 20 volts or do yyou
need to have 2 batteries? And if this is
the case, how do you hook them up to
work properly?

The question remains--do you actually know anyone who OWNS a Henry. I don't give a rat's ass what some dinosaur says he has up on 75 meters late at night. He likely has nothing at all or an Ameritron. Just like you, those guys are also blow hards.

Yep, but this guy said the problem would come and go, as if something was being turned on and off. Folks put those zappers on the patio and forget they own them until a big bug gets stuck and catches fire! It might be something like a sprinkler system coming on or something similar. He needs to df it down to a small area and then try to see what gives. Might be something inside a house. Even poorly shielded electrical motors could cause rf problems, and the neighbor might be vacuuming the house!

A car battery is designed for a 12 volt system. It should be stable at
about 12.5 volts and charge from an alternator/generator at 14 +/-
volts. Put 3 6-volt batteries in series and you will get roughly 19
volts.

EliotAssoc wrote:

2557. Homebrew Mobile beam

Newsgroup: rec.radio.cb
Date: 1999-09-13 00:00:00 UTC
From: Tinker <Speed_Buggy@hotmail.com>
Message-ID: <7rk2gkpav1@ins23.netins.net>
Source record: 2557

I am getting into Fox and Hounds and was wondering if I could make a Homebrew mobile beam to make tracking a little faster. Has anyone ever made such and antenna ?
Is there any webpages on building such an antenna ?
I would like to make it fairly small and maybe even hand held so I can get out of my mobile and use it. I will be using this on the regular CB a.m frequencies , as these are the old CB fox hunts . Not ham radio as some might think (Just don't feel like getting flamed so I will explain right of the bat).
Thanks A Million !
Tinker

Take a macho magnet mount. A 5' firestick II antenna. Four 4' flat bars. Like the ones you use to connect chain link fence together. Arrange the bars to form a plus sign, put the magnet mount in the center of your +, the antenna in the mount and you have an indoor antenna. Or make yourself a dipole.

Or, you take a 6 volt battery and wire it in series with the stock electric system.

Break the leads going to the alternator output on the stock electric system and run a cable to the positive lead of the 6 volt battery.

Voila. you have an 18 volt system, charging, and 12 volts to the rest of the car and etc.

No, I am not saying that I am the typical ham operator.

What you had asked is if someone knew people who had legal limit (Henry) amps.

Yes, I do.

As a matter of fact, I seem to know more people using ham amps than people who aren't... At least in the 6 to 8 hundred watt level (and by Ham amps, I would consider only people running all band, all mode amps, not 10 meter only amps).

what you need is a signal direction finding loop. I believe that is what it is called, anyway you can buy these or make one, there is a schematic in one of the old qst magazines, not sure which issue. and IM not sure where you can buy one, it is about a one foot loop with a one foot handle, sorry I couldn't be of more help but maybe it will get you going in the right direction.

Sounds like someone is giving you a line of bull. Unless that Dodge has a 1/4-1/2 inch thick roof that shouldn't be an issue. My guess is there should be sufficient room between the headliner and roof in the domelight area. Measure to be sure. You might try e-mailing Wilson for some dimensional info.

John Callaci wrote in message <37DD8084.35857360@tnl-online.com>...
:Now I'm confused... I just called my local radio shop about installing a
:Wilson 1000 hard mounted on the roof of my Dodge Ram truck. They told
:me that the metal was to thick and the headliner ti close to the roof so
:they recommended a Antenex ? 600 series.
:
:Any clues... Do appreciate the info. I was set on the mag mount Wilson
:then convinced myself to get a permanent unit.... now this.

They dont "yak" on them as much as you think, it cost to much to repair. Do drag racers stroll around town in their race cars? no, and their reason for not driving around town in them is not a legality.

>What other "sporting event" is specifically organized to
>break federal laws?

Well if the laws are that important, then why such a big budget cut for the FCC?
It sure seems strange to me that the FCC has fewer employs but there is new prisons going up everywhere at an astounding rate.

It just seams like you make a big deal about it for reasons other than legalities.

Cross-posted to: rec.radio.cb,uk.rec.radio.cb

I tuned my homemade vertical antenna and had 1-1:1 on 26.500 rising steadily to 1-1:9 on 28.000.

Then I tested it again today and it is 1-1:4 on 26.500 rising to 1-2:1 on 27.000 and falling back to 1-1:7 on 28.000.

I understood that usually you ended up with a "u" shaped curve but I have a "n" shaped curve.

Any ideas?

Thanx in advance

The 2000 is a 5/8 wave and the Max-99 is a half-wave. The Max-2000
should still be the better antenna, and priced accordingly.

I can't see why the ABS-1600 would be bad. Shakespeare is not known
for making shody antenna's. They make the military antennas and all
the boat antennas.

Well, it certainly would be an interesting arrangement. You could charge two at a time from the alternator, or you could build a board to invert the voltage and then reduce it back to 20 volts at a lower amperage. This all gets a little Buck Rogers. If your intent is to overdrive power transistors, I suspect you could spend a fortune and not get what you are looking for, unless of course you are looking for fried transistors. Why not just consider running something approaching a legal station and save the money you plan on wasting here on a better set of wheels?

"Tiny handful", no. Far from it, unfortunately. 75 meters (particularily 3901 and 3950) abounds with illegal operators. Excessive power, threatening communications, malicious and deliberate interference, etc.

"Soon get their ass caught", yes. Been happening for several months now. The FCC continues to build cases and remove the most blatant offenders from the bands. This is why most of the prime culprits have now brought their hate and libel campaigns against each other to the Internet. A quick glance at the rec.radio.amateur.misc newsgroup will show you what I mean.

>Didn't Pork Butt lose his license for that crap?

This is a long story in itself. He either did or did not "turn in his license voluntarily", depending on who you believe. "Big Al" did however receive a suspension from operating on HF for 120 days. One of the reasons was that, upon a recent FCC visit, the agent noticed a large amplifier on the premises which was capable of operation on the amateur bands of far more than the legal 1.5KW.

Make a bracket an attach it to the middle of the bed just behind the
cab and mount a 7 foot Firestik to it. This will not only look great
but will perform great.

>73 de Tim 2-IR-082 Texas USA

This statement is absolutely false. The X-Force product is of the "cleanest" amps available today. Texas Star's are very trashy on the spectrum analyzer. To answer the first post, yes there is a difference. The standard X-Force is a very high quality unit, several design changes has made it a step above the rest. If you're a major SSB'er, they are available in TRUE class B biasing for SSB. I have personally run a X200 in the house on a power supply and was the "home friendliest" amp I have run next to my Amp Supply.
So much for the "Class C crap" assertion.

The unit needs a good ground, sounds like the coax ground isn't soldered very
well, or antenna isn't grounded properly.

Find you a new installer, my buddy installed one in the rear center of his 98 Dodge Ram Club Cab, and it talks, by the way, get the 5000,it is a better antenna, no matter what anyone tells you, plus the roof mount kit has the better coax with that thru the roof kit only. RG8x.. the 1000 kits use rg58 or 59u. less quality, more loss. The 5000 model coil is bigger also.

My first CB was a set of walkie talkies that my father got. I remember walking out to the end of our neighborhood, which is near the interstate, so I could pick up the truckers.

I have had many different types of radios. One of the coolest radios I remember having was a Radio Shack crystal radio kit. Perpetually free AM radio from a single diode and single earphone.

I also had a GE table radio that had a single walkie-talkie that went with it. The table radio was an AM/FM/CB. It only had one channel, 14, and had a morse code key built into both the table radio and the walkie talkie.

I have a davemade m400 and the the eqivalent Xforce x400 and they are identical except for the case but inside you cannot tell any difference. both did about the same watts. Not sure what has been changed. A friend has a davemade m200 made for ssb and am it is class ab on ssb and class c when in am mode and the bias is only switched on during transmit . It has worked well for him for 3 years now in a mobile with a 2950.

>Wow, I guess its a good thing that most Hams know this. Due to this revelation I'm assuming both the Alpha, and the Henry amplifier companies will soon be out of business because no Ham would ever use the 3-10K watts of output that that these amps are capable of.....

Time to sell my company stock while the "gettin is good".<

Most hams **DO** know this, and that's why all those amplifiers you mentioned cost as much as they do. If they were selling as prolifically as you suggest, the price would drop.

Any radio operator with *ANY* amount of RF propagation knowledge or practice DOES know that an external amp is **USUALLY* a luxury at best, or a nuisance at worse. If it was that absolutely important to have to communicate, ships at sea and every military HF radio would be sporting kilowatt-plus power.

The truth of the matter is that they have all learned that you make your money at the antenna, not the amp, as so many "QRP" operators in the Amateur service can attest.

And as for the "3-10K watts" you refer to, I hate to burst your bubble, but a great number of these higher-power amps are NOT sold to CBers OR Hams...they go to commercial, military and broadcasting services.

>Yeah, right. Tell it to "Big Al", "Pork Butt", and the rest of the
>multi-kilowatt club on 75 meters.

Trying to rationalize high power amplifier use in the Amateur Radio service based on the antics of those creeps is like categorizing all CBers as gene-pool-deficient alcoholics based on the profanities of a few idiots.

Are you an idiot? Are you discourteous and rude to everyother CBer on the channel? Probably not, but I am sure you would take offense at being considered as one just because I can relate a situation where I have run into a rude or drunken CBer.

And most of the 40/S9 signals I know of personally on 75 are running 200 watts or less output.

"It's in the antenna...not the amp!"

Found it!!

Twas a loose connection at the antenna.

In reply to the ? about what sort of antenna I built, It is a simple 1/4
wave vertical made out of telescoping aluminium tent poles. :)

I now have 1.1-1 at 26.500mhz and 1.8-1 at 28.000mhz :)
Yippee here I come! ;)

Some common Q -Signals used on SSB ...

QRM - Is my transmission being interfered with?
QRN - Are you troubled by static?
QSB - Are my signals fading?
QTH - What is your location?
QSL - Can you acknowledge receipt?
QSY - Shall I change frequency?
QRT - Shall I stop sending?
QSX - Will you listen for ____ on ____?

and ...

QRZ - Who is calling me?
QRA - What is the name of your station?
QSP - Will you relay to _____ ? (usually a message to a named city)
QRL - Are you busy?
QRK - What is my signal intelligibility? (1-5)

Nope. As Dave said, they were designed for use on CW nets to aid in passing faster "traffic" messages. A complete series of Q-codes (the N series) is used for just that purpose. For example (QNI, QNX, QNU). Q codes don't have a thing to do with trucker lingo.

No, you are wrong. Amplifiers sell for as much as they do because of the
price of new parts.

None of the manufacturers are out their getting rich.. Your right, a lot of
the people on the band do not have the means to run legal limit (or more),
but judging from the amount of 8877s sold (and 3-500Zs), their are at least
a couple people using them!

>
> Any radio operator with *ANY* amount of RF propagation knowledge or
> practice DOES know that an external amp is **USUALLY* a luxury at best, or
a
> nuisance at worse.

That is total conjecture at your end. I have found that here in Texas, most
hams are capable of running nearly 1200 watts or more.

If it was that absolutely important to have to communicate,
> ships at sea and every military HF radio would be sporting kilowatt-plus
power.

Bullshit. The military doesn't have to compete with the idiot paperchasers,
and ships at sea have their own protected frequencies, too.

Not to mention the fact that most military comms are at the VHF and above
level now.

When I was in the Marine Corp, we had a 10,000 watt PEP mobile amplifier.
It was the mobile version of a Collins 208-10U. Ran a pair of 4CX350F tubes
driving a 10,000 tube.

Makes you wonder, doesn't it..... Guess the military DOES believe that
multi-kilowatt can be important.

>
>
> The truth of the matter is that they have all learned that you make
your
> money at the antenna, not the amp, as so many "QRP" operators in the

Amateur

You don't make your money at the antenna, you make your gain at the antenna.
Big difference between money and gain!

>
> And as for the "3-10K watts" you refer to, I hate to burst your
bubble,
> but a great number of these higher-power amps are NOT sold to CBers OR
> Hams...they go to commercial, military and broadcasting services.

Bullshit (yet again. This seems to be a trend with you).

I can personally attest to quite a few amplifiers capable of 3K output.

If you really believe the drivel your posting, I have some nice beachfront
property for sale in Northern Arizona!

Have a nice day, though.

I share the same view along with many others. We would also like to see something setup in the UK. I have a website which may be of some interest to those who would like more information about Packet radio on CB and HAM. I'm also hoping for some discussion topics regarding this thread to appear on the message board provided :-)

Kind Regards
Greg Tuby

The Website is at: http://www.qsl.net/ukpg to mail me, you may find my mail address on the website.

Robert Walling wrote in message <37DE432B.6C2FE2EA@wcom.com>...
Packet on 11 meters is illegal in the US, but overseas, there are some countries such as Germany and Holland which have legalized it on certain channels (I beleive channels 24 and 25). It will be interesting to see what the results of this legalization are, maybe someday it could be legal in US. Would be a great alternative to getting a linear amp, you could just digipeat thru other stations to get distance instead of upping the power, causing less interference problems. Plus, for those who like CB, but don't like all the noise that goes with it, packet is great for those who just want to be able to communicate without all the noise and garbage that goes along with it.

HA! OK, whatever you say. Hey I've got a great piece of real estate in Clearwater, Florida for sale, its alittle squishy when you walk on it, but what the hell, people need to get in touch with their Darwinian roots. Are you interested?

PS: You should check into the Liberty Net some Saturday night on 75 meters and tell those guys their amplifiers are for "Commercial" and "Military" use only, and they should stop using them immediately.

"Hey I've been called an Asshole by experts, and believe me, you're no expert"

Get the 1000 or the 5000 mag mount. run the coax through a small hole and grommet. I had a mag mount 5000 and then switched to the surface mount 5000. Believe it or not, the mag mount worked better and tuned flatter. Put the antenna in the exact center of the roof and your ready to talk.

Both are good boxes if you are looking for a comp style amp. Both have
been proven to be good solid amps. Both are available with Bias for SSB
at an extra charge(and a long wait). For me it is Xforce. I just like
the look and build quality better on the Xforce. I also talk SSB so I
need a Class B box. I like the Xforce Biasing scheme(#12) better than
daves. All of the Xforce amps I have used seem to go flat with no
problems and all made more power than I was hoping for. All in all a
clean comp style amp.

Wildcat wrote:

> "The Black Tube" as it was called, was a replacement for the final tube.

The Black tube was a replacement for the Voltage rectifier tube. Not the final. You probably cant find one nowadays but I can make you one in 15 minutes with some diodes and a tube octal. All this does is raise the voltage to the entire radio. My unit gained about 6 honest watts when I black tubed the radio. Then most people "strapped" there units. All you did was add a jumper wire to the large white ceramic resistor in the output stage. This increased the voltage to the plate of the final which caused the radio to make more power. I learned a trick to use instead of strapping. Get a 50uf @450 cap. Solder this cap across the resistor instead of using a jumper. Watch polarity!!!! the - goes toward the tube!!!! Now when you supply modulation to the radio the cap will slam voltage into the final causing it to swing like a bastard. This is easier on the rig as well as the carrier does not go up. My unit keys up at 5 watts and swings on honest 40 peak watts! It is one of the loudest radios you will ever hear with a D104 mic installed.

have fun!

Ok I just used a Cherokee AH 100 last night in my front yard. I was on 27.455 lsb talking to 4 other guys. one guy was 2 miles away showing full scale and sounding clear. The next guy was 10 miles away and showing 5 Su. He could hear me no problem. He is using a moonraker 4 beam though. The next guy was 14-15 miles away. He could hear me but he had to rotate his Wilson beam to get me in. He was not showing any signal but i could hear him fine. The last guy was 8 miles away with no problem at all. I spent 10-15 minutes out there talking with them. It was a kick. The little Ah 100 will eat batts on SSB though. the one I had showed 9 peak watts on SSB.

I would think a nice Saturn V would
be a great antenna. Now the trick is to find
one.

>Subject: Re: Local Radio Operator Questioned by Police
>From: "Toll Free" tollfree@bigradios.com
>Date: Tue, 14 September 1999 09:09

>No, you are wrong. Amplifiers sell for as much as they do because of the price of new parts.<

Hmmm.....methinks you sip to freely at the watering trough, Toll.

It is a basic tenet of commercialism. The more you make of something, the less it costs.

My Ford Contour only costs about $12.5 after I loaded it up. Yet a private aircraft of far less duarility costs 10 times as much to purchase.

CB radios of the 60's and 70's had precious few features and only 23 channels, yet the 1990's versions have SSB, weather channel monitoring, and even DSP type audio processing, yet the prices have changed very little over the decades...why? You are selling a hell of a lot of them. Suddenly cut your retail sales of CB's by 50% and watch what happens to the price.

You know as well as I how precious little it takes to really make a GOOD linear in terms of the number of parts. Mass market linears (not just the Amateur market and the few really dedicated SSBers...put them out there en masse) and watch the price drop.

>Your right, a lot of the people on the band do not have the means to run legal limit (or more), but judging from the amount of 8877s sold (and 3-500Zs), their are at least
a couple people using them!<

That wasn't in question, Toll. As a matter of fact, there are a few folks with them..quite a few...but not enough to adjust the Fair Market Value of the average linear to a more palatable price range.

>That is total conjecture at your end. I have found that here in Texas, most hams are capable of running nearly 1200 watts or more.<

No conjecture at all, Toll....26 years and 11 months as a licensed Ham from which to make an informed opinion.

>Bullshit. The military doesn't have to compete with the idiot paperchasers, and ships at sea have their own protected frequencies, too.<

Back to ya, Amigo. If the propagation isn't there, and you don't have INMARSAT or GMDSS, you don't talk.

>When I was in the Marine Corp, we had a 10,000 watt PEP mobile amplifier. It was the mobile version of a Collins 208-10U. Ran a pair of 4CX350F tubes driving a 10,000 tube.<

Semper Fi, Devil Dog....Retired GySgt USMC, 20 yrs Avionics Tech here...also fixed point HF station chief at one point. There ARE some heavy amps out there, but you know as well as I do that nothing less than Division can carry around a 10K amp...maybe occassionally a regimental landing team...but company sized units just don't have the luxury of dragging the surplus gear for that kind of brute power along. It's an exception to the rule, and you know it, Leatherneck!

>Makes you wonder, doesn't it..... Guess the military DOES believe that multi-kilowatt can be important<

I didn't say it wasn't important or that it didn't happen. But again, you aren't going to walk into a field HQ below Division and see ANYTHING like what you quoted.

>You don't make your money at the antenna, you make your gain at the antenna. Big difference between money and gain!<

A-N-A-L-O-G-Y.....It you feed 1000 watts into a dummy load, all you did was heat up the room and maybe radiate a small quantity of usable HF...I know, I know that lot's of guys will tell you they loaded up a dummy load only to have someone respond to them!

But I also know people who are using high power to overcome pisspoor antennas. That's an expensive way to do it. There's LOT'S of guys using FAR LESS than legal limit into modest tribanders or even monobanders that are just as competitive RF wise as some of the ego-trippers with a KW under the desk.

>Bullshit (yet again. This seems to be a trend with you).

>I can personally attest to quite a few amplifiers capable of 3K output.<

>If you really believe the drivel your posting, I have some nice beachfront property for sale in Northern Arizona.<

RE-READ the post, Toll...NOWHERE did I say anything even remotely like there were NO amplifiers capable of those powers. Quite the contrary. When I was station chief on Oki, we had a shop full of Henry 3K-Ultras. They are certainly there.

WHAT I SAID (no bullshit..just fact) was that **MANY** of those amplifiers go to commercial, military and broadcasting services.

I DID NOT say that those amplifiers don't exisit. I said a lot of them are going to services OTHER than hobby useage.

I DID NOT say that the military doesn't use amplifiers (that last paragraph simply reiterated the fact that they do). The small units can't and don't carry them. There ARE fixed point stations running lots of power...but they are the exception rather than the rule.

I DID NOT say that neither Hams nor CBers don't use them. We wouldn't have regulatory prohibition against them if they weren't out there or being abused by those who aren't supposed to be using them, would we?

PLEASE don't put words in my mouth or try to read ANYTHING into my posts except the black-and-white simplicity of the letters on the screen.

OK ... Sierra Electronics has CB's for Motorcycles and
you can check them out at www.sierra-mc.com .. They
are pricey but they do carry them, complete with helmet
hookups .. etc for a full installation ... Most are bag units
which you can take with you or put up in a trunk when you
aren't on the bike ...

I have a 89 Yamaha Venture Royale which has a AM/FM/CB
installed as OEM for that year bike ... Works great except the
CB is a bit on the weak side .. about 1 1/2 watts. The OEM
antenna fell apart a while back and of course, wanted a bit
of OOMPH to go with it. Old antenna came off and replaced
it with a 3' Firestik II on a conventional mirror mount which
I mounted on the original stem which is welded to the frame
for the trunk ... It is flat edged on the end where the antenna
was mounted so used the flat edged mirror mount .. Think I
got it at RS .... for the OOMPH, also installed a Cobra 200XL
wired directly to the battery, and yes, it works just fine in
med power out ... The 3' Firestik II handles both the AM/FM
and CB through the OEM splitter but am looking to change
the splitter out to one that Firestik carries which has a PL 259
hookup from the antenna. The OEM antenna cable is hard
wired to the splitter ....

You can see the install at www.1spec.com/gmg under the
scooter page ... I am waiting on some new piccys which
will show close ups of the antenna install and cobra mount
in the trunk ... Hopefully next week ..

If you have any questions you can email me direct from
my www page ...

Oh you sound just like
a CBer. "I'll be around for ever" The last person that
said that on the air was so stupid that he was walking
on the train track while listening to his walkman. The
train was coming down the tracks, blew his horn, so
what did this "Cber, who will out live everyone" do....
Jumped over to the other track.....To which a
north bound train promptly scattered him all over
the place. The lesson we learn from this story is.....
Next time you place you're order, don't forget to say,
NO ANCHOVIES PLEASE!!!!!!

The Landshark

P.S. you're still a fucking dick, please die now.........

Yes, we get the drift. Wherever Toll Free is, there is likely *something* illegal going down. What is it this time....looking for a klystron tube to build a gigawatt splatterbox?

No, the question was whether or not licensed amateurs were using 10K Henrys.
The answer is--maybe one, somewhere, but nobody has met him yet. I gather that
you know of a number of guys who own Henry amps and good for you and them too,
but they are all CBers using them illegally.

send a email to henry and ask them about there sales. most are too liscence
hams and theres no shortage of them being sold. if you dont know anybody using
them you must talk to yourself all day.

No, dreamer, they are all not CBers.

As a matter of fact, I can name more amateur operators who are capable of breaking the 5Kw level than I can Cbers, and I build the large CB amplifiers.

You continue to live in your fantasy land, and I will continue to live in the real world.

We will just have to agree to disagree with this one.

And no, the question was not whether or not licensed ops where using 10K Henry's. Henry doesn't even make a 10K amplifier for general use. The largest they make is the 8K Unltra, and while it has certainly done more than 10 grand on my bench, it has NEVER been marketed as such.

Nice day!

Toll Free

I read some place were CB RADIO can have packet radio somewhere. I do have a printed Manuel on it. Here is what I copied;

Sec. 95.420 (CB Rule 20) May I connect my CB station transmitter to a telephone?

(a) You may connect your CB station transmitter to a telephone if you comply with all of the following:
(1) You or someone else must be present at your CB station and must--
(i) Manually make the connection (the connection must not be made by remote control);
(ii) Supervise the operation of the transmitter during the connection;
(iii) Listen to each communication during the connection; and
(iv) Stop all communications if there are operations in violation of these rules.
(2) Each communication during the telephone connection must comply with all of these rules.
(3) You must obey any restriction that the telephone company places on the connection of a CB transmitter to a telephone.
(b) The CB transmitter you connect to a telephone must not be shared with any other CB station.
(c) If you connect your CB transmitter to a telephone, you must use a phone patch device with has been registered with the FCC.

Is voice CW? My point is that the use of Q codes on SSB is just as
immature and senseless as "truckers lingo". If you can bash "flip
flop", "pedal to the metal', and "bear in the air" then you can also
make an argument for bashing QRM, QSY and QTH. Doesn't anyone
know how to speak english anymore?

I am a newbie so be gentle. I have "very weak" transmission on my boat according to friends. All connection have been done by a professional with the proper type solder. SWR is excellent. Have tried two different CB's that work fantastic in my "land rigs" and they do the same thing. Have changed the antenna, twice. Any ideas?

Are you using an antenna designed for marine use? I am assuming that the boat is not metal but fiberglas or wood. This creates other problems for a ground plane. Even with good swr, it doesn't mean that the signal is getting out well.

It might be that you are not using a marine antenna or your not using a marine radio. If thats the case, change you antenna or your radio. IT ALL HAS TO BE MARINE STUFF, ANY CB STUFF WILL BURN UP IF YOU HAVE A MARINE ANTENNA USING IT ON A CB RADIO IT WILL BURN UP. IF YOUR USING A CB ANTENNA USING A MARINE RADIO IT WILL BURN UP. GOOD LUCK!

As others have said, "use a marine antenna".This is a antenna that
does not require a ground plane. Antennas like these are generally
used on campers or boats or anything that can not supply a
substantial area of sheet metal. The sheet metal is what make
the ground plane on most vehicles. When the vehicle is made
of fiberglass this cannot be done adequately.

P.S. The marine antennas are also termed a half wave antenna.
I believe Firstik carries them. Look for "no ground plane"
at this link.

Toll, What are the laws of physics regarding volts and harmonics? I cant argue against what i have seen, this same question was posed to dave sometime ago so an amp was tuned at 20 volts and also one tuned at 15 volts, if i am not mistaken amp was made to do the same watts with of course less drive applied at 20 volts, the one at 20 volts showed no more, or even perhaps less harmonics than at 15 volts on a HP spec Analyzer. I would like to see what the Motorola book says also.
I have an open mind.

None of your business!

What would the point of me naming people who operate illegally be on a
public forum.

If you are too stupid to realize, or foolish, or whatever the case may be,
that people on the ham, as well as Cb bands run illegal (or even legal QRO),
then that is your fault.

I am sorry, but none of the people that I know would really appreciate me
telling the world who they are?

Would your cocaine dealer like it if you posted his name?

Doubtful.

Hello Toll Free: Good posting, the subject of volting needs to be further discussed here. A lot of people don't have the inside poop on volting.

Doesn't Dave Made sell a external voltage regulator that can be adjusted for different voltages. How does that work? Is that regulator just for a separate alternator?

I asked Sean a while back, about a special regulator that would allow a normal 14 volts for the vehicles battery and a separate higher voltage for a amp. I put a new 150 amp alternator in my truck, from Wangner, but haven't done anything else with it. Is there a external regulator that is more better?

Jay in the Mojave.

Go to Shakespeare's website. Their the ones who make marine CB
antenna's. Using a normal CB on a boat with a marine antenna will not
burn up the CB the other guy said.

You ignorant bastard.

What the *&^& does a phone patch have to do with you connecting your computer to a TNC to transmit packets of computer data over radio.

I really do wish that you would quit posting, because so far, most anything you have posted has been wrong, at the minimum!

You, Pee Wee, have no idea of the reality of the world, no idea what you talk about, and have little, if any, working knowlege of radio! Although, you self proclaim yourself an "Old Timer", and love to brag about your "CB Radio History".

Newsflash, Pee Wee... Nobody gives a shit! And the rest of the world would ask that you please stop sending out the wrong information.

To those whom I offended, sorry. I am really tired of this guy.... For the second time.

And that is my 10-4, Pee Wee. Hope you don't have to get a 10-5 while I tell you to go 10-7.

Get it now??? Maybe if I drop myself to the level of "CB Radio infatuated idiot who has no idea of what happens in the real world", you might get it!

Your CB radio does not have to be "Marine Rated".

That is BS.

I would tend to lean at you do not have enough ground plane. Or, you are using a smallish antenna.

A little more information would be helpful.

Hey, It wasn't MY idea to name these guys--it was your idea--see below in your own words. You argue that you know alot of hams who are using illegal power, and you can name them, but when pressed, you skirt the issue by wanting to maintain privacy. You and I both know it is a load and you don't know ANYONE. If you did, you would follow through with what you said. You just show that you are two-faced, Toll. Sorry to be harsh, but I suspect you know one old geek somewhere who has an old Henry capable of 3K and you extrapolate that EVERYONE has a Henry. Just isn't the case. If you can name one amateur using illegal power, I can come up with 300 who aren't. Get back to CB and forget this-it's off topic.

Dave, X-Force, and a number of others make voltage regulators that you can put on a radio.

I have seen most of them, and they all look pretty much the same.

My advice is to find a GOOD alternator shop and ask them for the prices on a good Transpo Electronics regulator. I am using one for each one of my alternators (3 for the radio station), and have had good luck with them.

I run the blue ones (model number escapes me), and the are OEM Pheonix Gold. The Pheonix Gold label on them runs the price up nearly another hundred dollars.

Hope this helps!

2716. Re: Antenna Spacing

Newsgroup: rec.radio.cb
Date: 1999-09-14 00:00:00 UTC
From: AB7RS <tglenn@imt.net>
Message-ID: <37DEEA06.12D9@imt.net>
Source record: 2716

Feeding 1 antenna with a 1/4 wave spacing produces a broad lobe with a
slight amount of gain a a sharp null toward the parasitic element.
With the spacing at 1/2 wave there is a figure 8 pattern with the
nulls broadside to the array.slight gain on the lobes.
3/4 wave and the pattern is triangular,3 nulls,3 lobes.
If you feed both antennas the pattern still varies with spacing and
also with phasing,90" out of phase,180" out of phase etc.
Literally the possibilities are endless,even on a car.

Tnom,

You bring up a very good point. I've always preferred "normal" speaking English, to any form of "lingo", whether it be truckers, "Q" codes, "10" codes, or stupid ham lingo ("we're destinated", "Hi hi", and my personal favorite, "fine business").

To me, it's the height of hypocrisy to bust on someone for using 10-codes or trucker's slang, and then use inappropriate "Q" codes, or worse, the ham that bashes CBers for using lingo, as he's fine businessing all the way towards being "destinated".

SSB operators, like I've pointed out before, seem to run somewhere in between the 2 extremes of either trying to sound "professional" (complete with a complete, if inappropriate "Q" code vocabulary), to being completely laid-back, with nothing but regular English to communicate with. I much prefer the laid-back groups. You don't get any gold stars for knowing the most codes....

That's not to say that codes do not have their place. They were designed to shorten transmission time, for necessary traffic. They aren't really needed on CB, during casual conversations, and IMHO sound a bit silly.

Cellular bands are another animal, covered by the communications privacy act. But there are no provisions that ham radios must not transmit out of band. The reason again is that the FCC places a large amount of responsibility for operating within the rules, on the ham operator himself. He is supposed to know where the end of the bands are, and know enough not to go beyond. Same with the 1500 watt power limit. I can legally run an amplifier that would put out 5 KW at full drive, but I am responsible to insure that the output level never exceeds 1.5 KW.

That is the difference between the ham radio service, and a service such as CB or GMRS, where technical conformity is maintained through special equipment requirements called type acceptance.

Unless you own a company that caters exclusively to Hams. Then you can
charge as much as you want because you know they'll pay.

It seems like it is all over & I got my idea of 10 codes from when I first got on CB in the 60's & the MARYLAND STATE POLICE had these 10 codes

Radio Codes & Signals

Email us your Radio Codes or Signals

==========MARYLAND STATE POLICE 10 CODES
10-0 Caution 10-52 Ambulance needed
10-1 Unable to copy - change loc. 10-53 Road blocked at ____
10-3 Stop transmitting 10-54 Livestock on highway
10-4 Acknowledgement (OK) 10-55 Intoxicated driver
10-5 Relay 10-56 Intoxicated pedestrian
10-6 Busy, unless urgent 10-57 Hit & Run (F, PI, PD)
10-7 Out of service 10-58 Direct traffic
10-8 In service 10-59 Convoy or escort
10-9 Repeat 10-60 Squad in vicinity
10-10 Fight in progress 10-61 Personnel in area
10-11 Dog case 10-62 Reply to message
10-12 Stand-by (stop) 10-63 Prepare to make written copy
10-13 Weather -- road report 10-64 Message for local delivery
10-14 Prowler report 10-65 Net message assignment
10-15 Civil disturbance 10-66 Message cancellation
10-16 Domestic problem 10-67 Clear for net message
10-17 Meet complainant 10-68 Dispatch information
10-18 Quickly 10-69 Message received
10-19 Return to_____ 10-70 Fire alarm
10-20 Location 10-71 Advise nature of fire
10-21 Call _____ by telephone 10-72 Report progress on fire
10-22 Disregard 10-73 Smoke report
10-23 Arrived at scene 10-74 Negative
10-24 Assignment completed 10-75 In contact with _____
10-25 Report in person (meet) 10-76 Enroute
10-26 Detaining subject, expedite 10-77 ETA
10-27 Driver's license information 10-78 Need assistance
10-28 Vehicle registration info. 10-79 Notify coroner
10-29 Check for wanted 10-80 Chase in progress
10-30 Unnecessary use of radio 10-81 Breath test
10-31 Crime in progress 10-82 Reserve lodging
10-32 Man with gun 10-83 Work school crossing at _____
10-33 EMERGENCY 10-84 If meeting _____ advise ETA
10-34 Riot 10-85 Delayed due to
10-35 Major crime alert 10-86 Officer/operator on duty
10-36 Correct time 10-87 Pick up/distribute checks

10-37 Investigate susp. vehicle 10-88 Present telephone # of ______
10-38 Stopping suspicious vehicle 10-89 Bomb threat
10-39 Urgent - use light & siren 10-90 Bank alarm at _________
10-40 Silent run - no light/siren 10-91 Pick up prisoner/subject
10-41 Beginning tour of duty 10-92 Improperly parked vehicle
10-42 Ending tour of duty 10-93 Blockade
10-43 Information 10-94 Drag racing
10-44 Permission to leave ___ for 10-95 Prisoner/subject in custody
10-45 Animal carcass at 10-96 Mental subject
10-46 Assist motorist 10-97 Check (test) signal
10-47 Emergency road repair at ____ 10-98 Prison/jail break
10-48 Traffic standard repair at 10-99 Wanted/stolen indicated
10-49 Traffic light out at ______
10-50 Accident (F, PI, PD)
10-51 Wrecker needed

==========
=

MONTGOMERY COUNTY POLICE:
10-1 Receiving Poorly
10-2 Receiving Well
10-3 No Transmitting Except Emergencies
10-4 Acknowledgement (message received) Two Man Unit
10-5 On The Scene
10-6 Busy
10-7 Out Of Service At (location) Code_____
10-8 In Service
10-9 Repeat Last Message
10-10 Out Of Service, But Available For Call At (location)
10-11 You Are Dispatching Too Rapidly
10-12 Advise Weather & Road Conditions
10-13 Request Wrecker For Passenger Vehicle At (location)
10-15 Transportation Prisoner In Custody Code______

>
> What is the difference?

BIG difference. I'm really surprised that you don't know it.

Compliance with FCC part 15 or "FCC approval" is required on any and all receivers, tranceivers, computers, or any electronic device that has an oscillator source of a frequency greater than 10 Khz. The purpose for part 15 compliance is to ensure that said device does not emit harmful radiation (interference) to other services.

NOT to be confused with "Type acceptance", which is a special set of technical requirements that are assigned to tranceivers used in certain communications services, (above and beyond Part 15) designed to ensure that a non-technical user will always be within the technical rules of the service. Things like modulation limiters, 4 watt non-adjustable power output, 40 channel (as opposed to variable frequency) control, are examples of requirements for part 95 type acceptance. There are similar rules for the GMRS, Land Mobile, Marine, Aeronautical, and other 2-way services.

Since responsibility for technical conformity for the Part 97 amateur radio service lies with the ham operator himself, the radios are not required to be type accepted (But they still have to be part 15 approved).

>
> Your trying to say the same thing as the rest of the group.. But looking

RULE 20 - Telephone Patches and Telephony with CB - [TOP]

{A} You MAY connect your CB station transmitter to a telephone if
you
comply with ALL of the following:
[1] You or someone else must be present at your CB station and
MUST-
(i) manually make the connection (the connection cannot be made
by
remote control);
(ii) supervise the operation of the transmitter during the
connection;
(iii) listen to each communication during the connection;
and
(iv) stop all communications if there are operations in violation
of
these rules.
[2] Each communication during the telephone connection must
comply with
all of these rules.
[3] You must obey any restriction that the telephone company
places on the
connection of a CB transmitter to a telephone.
{B} The CB transmitter you connect to a telephone must not be
shared with
any other CB station.
{C} If you connect your CB transmitter to a telephone, you must
use a
phone patch device which has been registered with the FCC.

there, it work & I wan to thank you for not cussing as well :-) The link
worked for me.

If you really believe this, then why don't the major manufacturers pass out the mods for unlocking MARS / CAP ? gen Coverage with the purchase of a radio, or at least with the license for an amateur radio...

I would think that if it wasn't law, they would do it, just because it "enhances" the functionality of the radio!

Wait a minute. I remember seeing an advertisement for a Kenwood radio, when the general coverage units came out that specifically said to comply with FCC rules, they would not release the MARS /CAP mods without proof of proper license.

And as far as any amplifier being legal, if that was true, the Henry 8K Ultra would be legal for shipment in the US, as would the Commander HF-2500E.

I specifically know that neither of those amplifiers are legal for sale in the United States.

Also seems to me that somewhere I either read, or was told, that their is a cap as far as plate dissipation of an amplifier that would be marketed to the amateur community.

That, my friend, is why the two hole Alphas (8877) where not offered for sale in the US.

My comments stand.

Not to be an ass, but I personally know three amateur radio ops (2 generals, 1 advanced) within a 10 mile radius who operate in excess of legal limit, One of the guys uses an old 300a palomar to drive his henry, Which he has upgrade the 2 3-500Z to 4 3-500Z and a larger xfmr, and I have personally seen him do this, but I also would not think of sharing their names, as these guys are very good friends of mine. but it does happen. It just seems to me that they only tell us "legal" CBER'S!

And, for the last time, moron,

The rule says nothing about Packet radio.

Packet radio is NOT the same thing as a phone patch.

Quit posting disinformation and wrong posts to the newsgroup. It is fairly obvious that you have not a single idea of what you are talking about, now quit showing the rest of the world!

Attention Everyone,

Watch out for these.....

Jack

http://www.angelfire.com/az/firecommunications/

Contents as follows:
EXTREMELY DANGEROUS

This information came from Microsoft yesterday (9 Sept 99) morning.
Please pass it on to anyone you know who has access to the internet. You may
receive an apparently harmless Budweiser screensaver, entitled BUDDYLST.SIP.

If you do - DO NOT OPEN IT UNDER ANY CIRCUMSTANCES, but delete it
IMMEDIATELY. Once opened, you will lose EVERYTHING on your PC. Your
hard disk will be completely distroyed and the person who sent you the
message will have access to your name and password via the internet.
As far as we know, the virus was circulated yesterday (9 Sept) morning. It's
a new virus and extremely dangerous. Please copy this information and e-mail
it to everyone in your address book. We need to do all we can to block this
virus. AOL has confirmed how dangerous it is and there is no Antivirus
program as yet which is capable of destroying it. Please take all the
necessary precautions and pass this information to your friends,
acquaintances and work colleagues.

This is extremely important. There is an exec file going around called
"Funprog.exec" and it contains the CIH virus. If you receive it, DO NOT
DOWNLOAD IT.

But here is the worst part of it. This virus is being sent out from names
you know. Somehow they found a way to use other peoples screen names and
send out mail. If you are an AOL user and you get mail from anyone on AOL
including me that says @aol.com after the screen name DO NOT DOWNLOAD that
piece of mail. It will not be from that person that you think is sending it
to you.

AOL is very aware of what is going on right now. Please do not download
anything. I rather all of us be safe than sorry, until AOL fixes this
problem. Please forward this letter to all your friends.....

It's the same as the Tram D62, Browning Baron, and 132XLR.
Single conversion receiver. The PLL is limited on extra channels.
For the channels you do get, the radio itself will not operate
the full range. The clarifier operates on two different relay-
switched voltages, depending on what mode you're in. Makes
it a pain to modify. The main board has traces on both sides and
is really fragile and sensitive to excess heat from soldering irons.
The mods aren't worth doing in my opinion. I had a stock one
last year and dumped it on ebay. Hope that helps.
Larry

2752. Re: Travelling Antenna?

Newsgroup: rec.radio.cb

Keep in mind the antenna has to be small enough to fit in my luggage
(air flight) and something that won't potentially damage the rental car.
Small mag mounts might work, though I don't know which ones would be
best and fit in my luggage!

your best bet is to go with a small
mag mount antenna I`m a avis car shutteler i drive between idaho to
utah to wyoming to nevada where i drive rental cars to & from and my
handheld help out a lot with traffic reports, talking to other
shuttelers and we don`t leave marks on the cars and the magnet
mounts are small to keep in a brief case that`s my 2 ç

2753. FS: B & K Model 1040 CB Test Center

Newsgroup: rec.radio.cb

tollfree wrote:
<<No, The chuckle signifies that a ham is admitting that he uses his amateur radio on the 11 meter band. Something that I knew would spark an interest from you.>>

I think the chuckle is also one of recognition, i.e., acknowledging a fellow bootlegger. But that didn't really 'spark' me too much. However this did:

tolfree wrote:
<< I have seen nearly 8 grand out of the Commander HF2500E with my Kenwood driving it. It is a 3 tuber, export only.>>

What kind of an idiot would put 8KW on the ham bands? (I expect your usual lame excuses: it wasn't the ham bands, I used a dummy load, I didn't say it was my amp, I didn't say I did it, it was all theoretical, it was only for 10 seconds, I was in Brazil at the time, etc)

2755. SSB CB in Atlanta (new mailing list)

2757. Re: Marine problem

Newsgroup: rec.radio.cb
Date: 1999-09-15 00:00:00 UTC
From: pllo2a@aol.com
Message-ID: <19990915140443.01540.00000636@ng-ff1.aol.com>
Source record: 2755

some thoughts:
1) regardless of what other people have said,
you do NOT need a "marine" cb. a cb is a cb. the only difference between a land cb and a marine cb is a marine cb is more water tight so salt or moisture won't get into the circuitry. there's no difference otherwise.
2) if you're swr is below 2.5:1, you will NOT "burn up" your radio. it's obvious that you are using some kind of cb antenna.
it is correct that you can't use an antenna made for vhf marine freqs on cb but if you were, you wouldn't get a low swr.
3) if your boat is made of metal and your antenna mount is connected directly to a piece of metal with a large area, (approx 5X5 sq ft or more), it doesn't matter what kind of antenna you use. a land mobile would be better in this case. if your boat is wood or fiberglass, you need a marine or no-ground cb antenna. these have special tuning stubs, coils or capacitive circuits in them to fool the radio into thinking it has a proper ground plane and keep the swr low.
they arn't the best solution and somewhat in-efficent but are acceptible. they generally arn't made for linear amps or unusally high powered radios like rci 2970 for example.
4) the question that nobody has asked yet is, just what kind of range are you looking for?
using a no-ground antenna over flat water at 5 watts you may get 5 or 10 miles at best.
if you are trying to reach a land mobile, not on the beach, less.
a base near the beach with a high antenna, maybe more.
if you are using a decent quality mobile antenna mounted to a metal boat, you could and should expect more.
good luck.
jeff

Guy, before you go any further, do some research on what a "packet" is
in terms of computer terminology. Then apply it to radio. This may
help you understand what you are failing to explain.

I would not use one of these things, If you are going to run an amp through
a coupler, you'll achieve a lesser signal in the distance byfar than what
you would get by simply sticking a mag mount Wilson 1000 on your trunk lid
or the top of the car and just running the radio by itself with no amp.

I think your wrong here. Q codes are meant to make communication more
efficient, and during DX'ing on CB you need to get your contact going
quickly because the band opening may go away quickly. It helps to use
Q codes to obtain the desired info from the distant station as quickly
as possible because you may not be able to hear them at any second.

If your taking SSB around town, then your right, no Q codes are
necessary, but if the operators who are chatting tend to do more
DX'ing than local, they are going to use the Q codes out of habit.

I think you are wrong. QRT means that you will stop transmitting.
This means that you could either be turning the radio off or that you
will be standing by monitoring. By letting the other operator know
you are standing by, lets them know they can get in touch with you if
need be.

How about a model 222. Its 36' and can handle up to 125mph winds.
Note, this is a military grade antenna that will handle up to 25Kw
from 1.6-30Mhz. Goto their website: http://www.shakespeare-ce.com

2769. Re: Palomar 225 AMP - Any Good?

Newsgroup: rec.radio.cb
Date: 1999-09-15 00:00:00 UTC
From: Bill Eitner <kd6tas@netzero.net>
Message-ID: <37DFEB13.81A36CF7@netzero.net>
Source record: 2767

The 225 is a decent, economy model amp. Exports R Us has them on
sale for $80. That's an incredible price. The only thing that
might bother you about that amp is that the SSB delay is always
on. That means you have to wait for it to unkey before you can
hear anything when you're on AM. The 225 is the low-cost model
model in that line. The XL series (200, 250, 350, 450, and supposedly
soon to be 600) are the better units in the Blue Face (can say
Cobra, Galaxy, Magnum, or Palomar on the front--but they all have
blue faces) line. The XL series units have four power levels
instead of three, more output filtering, more heatsink surface area,
and a switchable SSB delay. Since you're using a SSB radio, I
suggest you spend a little more money and go with an XL series
unit so you'll have a switchable SSB delay. In particular, the
350 matches up very well with a tuned up Grant. On the other hand,
it's a fairly easy modification to add a SSB delay switch to the
225. You can do that and save some money. The 225 is an incredible
deal. I sell the Blue Face line as well as Texas Star and Pirate.
If a customer wants a 225 and is using a SSB radio, I'll offer to
add a SSB delay switch for $15. I use a large, red, push-on/push-off
switch mounted in the rear panel or a rocker switch mounted in the
plastic bottom panel so that the front faceplate retains it's clean,
stock appearance. I can't come closr the $80 price that Exports R Us
offers, so you might want to check with them and see if they'll add
the switch for you (if you don't feel confident doing it yourself).
Here's a link to their site: http://members.aol.com/CBs313/AMPS.html

2770. Re: Help Icom 707

Newsgroup: rec.radio.cb
Date: 1999-09-15 00:00:00 UTC
From: pllo2a@aol.com
Message-ID: <19990915144610.01540.00000646@ng-ff1.aol.com>
Source record: 2768

the other responder told you to ask icom for the mars mod. they probably won't give it to you without a mars or cap permit.
i haven't tried it but my book says icom made 4 versions of this radio. i take NO responsibility for ANY of this but here is what my book says:
on model 1 remove D12.
on model 2 remove D13.
on model 3 remove D12 and solder in D11 and D13 using icom part# DAN202U.
on model 4 remove D12 and D13.
these are all chip smd diodes so be careful.
the book warns that you should determine which model you have before starting this mod.
you're on your own on this so be careful.
good luck.
jeff

2771. Re: Palomar 225 AMP - Any Good?

Newsgroup: rec.radio.cb

David,
The old sayig goes "You get what you pay for" that is ever so true with the radio. Me personally have never ran the 225, but from what I hear from MANY people they are junk.#1 they are MASS produced, that for one shows that the quality would be less desireable. Now a question for you. Why would you want to run an amp on AM? #1 You will be breaking the law, #2 your neighbors will more then lkely hate you for the RFI. Now I'm not gonna' nit pic here at that cuz I have used an amp a time or 2 so I'm no hipacrit (how ever you spell it) In my opinion David...try for a Texas Star or a DaveMade. You mght pay a lil more..but I can assure you that you won't have too much problems with it. (as long as it's hooked up right of coure) Good Luck

>djenn@ev1.net

expect about a 100 watts ssb and about 30 watts am at 12 volts. they seem to
draw a huge amount of current so i dont think there very effecient at all and
they over heat fast so keep a fan on it but its a good buy at 99 brand new

if you call or write fair radio co., (a surplus house), you can, for a mere $4000.00 plus, buy a surplus 10kw amp, (tubes extra), that runs on 480 volts. the biggest obstical that i can see to getting one up and running is explaining to the power company why you want a 480 volt mains run into your house or buying the truck, diesel generator and cast iron antenna to handle that kind of power to go mobile.
other than that, they don't ask for a license of any kind.

Source record: 2779

Bill, Tim and all gang members,

The Palomar 225 is an excellent amplifier.
200 - 225 on am and 225 - 250 on ssb........

Bill, forget the switch....locate the delay
timing capacitor (electrolytic) and replace
with a smaller value....I like the extended
delay because it allows for break-in by other
stations or the occasional "QSK" and forces
responding stations to listen during the
switchover period! The extended delay is
provided to extend a "courtesy" to other
calling stations when operating in ssb mode!
Courtesy is in dire need of restoration on
all the bands.

I use one daily and have no trouble working
my share of international dx with a cobra
148gtl........

Keep in mind that to raise your signal by
one s-unit you have to increase transmitter
power four times to pull it off! The best
stations and operators in my mind are the
ones who can establish and maintain contact
with the minimum amount of power necessary!

Jack

"Do it right the first time, or
don't bother doing it at all"!

Quite a few people. Ask Command Technologies (or their sister company, QRO
Tech.) how many of the export amplifiers they have sold.

(I expect your usual
> lame excuses:

I don't use any excuses, and now you are fishing. Your usually a little
better than resorting to lies, Joe... Guess life must be getting to you.
If I was running illegal power, it IS wherever I want to run it. I have
never made a secret that I am capable of running illegal power, nor do I
make it a secret that I occassionally do it!

> it wasn't the ham bands,

Sure was. 20 meters to be exact!

> I used a dummy load,

Nope, into my long wire. I use quite a big balun.

I didn't say it was
> my amp,

As a matter of fact, no, it wasn't my amp. I make a good living, but I
prefer to build my own equipment.

I didn't say I did it,

No, I did say that I did it.

it was all theoretical,

No, theoretically, the amplifier is only capable of about 2500 watts output.
After all, it is only 3X3CX800A7s.

it was only for 10
> seconds,

Actually, I only keyed it for 30 seconds. I thought that was enough. That, and the wiring was getting a little warm. I am only wired with 4 guage to the mains.

I was in Brazil at the time, etc)

Nope, right here in Texas!

Joe, your still an asshole, and I really like how you have turned most of your attention to me. It is quite nice to see that I can still fascinate you after all these months.

Please don't seek any of that professional help you so richly need, as you might find out that I am not that bad of a person, and you have wasted the last couple months of your life devoting it to me!

my uncle was a general ham before he died 3 years ago.
he bought out a closed cb shop i savannah ga and bought up a bunch of ham equipment in hopes of opening up a shop when he retired.
his dreams never materialized as he died.
i went to visit my aunt shortly afterward and her livingroom floor and furniture was COVERED with radio gear. she said take what you want.
at the time, i had a ford tempo with the wife and 2 kids plus myself and the car packed so tight with stuff for the rest of our trip to w va, that all i could manage was a few antennas. the car was packed so tight, the springs had to be replaced after the trip.
when we got back, i tried to put her in touch with a shop that would go from here in fla and buy it all. she never called back.
i found out later that she threw it all in the trash.
I NEARLY CRIED AS I KNEW MY UNCLE PROBABLY CRIED WHERE HE WAS TOO.
i was ready to dive into the savannah dump but couldn't get time off work.
i have a van now and will NOT miss another oppertunity like that again!!!

Yes i have noticed that this antenna is "KICK ASS". I have one also.
Do not say that it "CAN WHOOP ASS" on the 102 stainless however.
If you do you'll get blasted by the conventional thinking among us.
Just be quiet and enjoy your higher gain, lower profile antenna. No
need to promote the secret to your success. Keep them scratching their
heads while you "KICK ASS" on the competition.

Subject: Texas license plate question

Question on the meaning of life and Texas license plates.

Last night, on southbound Hwy 17, a Chevy SUV type vehicle with
a Texas plate "TEN 300" nearly clipped me.

It was nothing personal. He nearly clipped several other cars,
motorcycles, big rigs, etc. while suddenly and jerkily changing
lanes without signaling. Or giving any indication, of any sort,
to the careful observer that he was about to do anything other than
remain in his own lane.

Oh, and he didn't necessarily pass any cars - sometimes he just changed
from one lane to another, stayed in that lane for a 100 yards or so and
then changed back into the same spot in traffic he started from.

Finally, got up the courage to pass him (and, I will admit here to
the unbecoming prejudice of assuming it had to be a woman with small
children). The driver was male, somewhere in his mid 30s to early 40s,
wearing a light tan business suit, and

READING A NEWSPAPER.

In commute traffic. On Hwy 17. [1]

So. What does the "TEN 300" plate signify? Is this part of a pattern
embossed on license plates by the great (at least its bigger than
Britain - but, then, most states are) state of Texas to be given to
idiots?

Those who are idiots even by Texas' standards?

Inquiring minds, etc....

--
sas
President and Head Girl, Nasty Girlie Gang
Ignorant Yank (tm) #3
DOD #1456

[1] For those not conversant with Bay Area geography, Hwy 17 was the
first freeway built in California (IIRC) and is a nice little

mountain road with lots of blind, decreasing radius curves, which is now a major artery into/out-of Silicon Valley. It carries, oh perhaps, several tens of thousands more vehicles per day than it was designed for. For political, geographical, and financial reasons it can't be expanded.

No, I never said that I was proud to do it, just that I do it occassionally.

You seem to be the proud one... Acting like the cop who found a pound of dope when he was writing the guy a ticket...

Then, he becomes the local hero because he found it... Not on any merit of his own, but because he stumbled upon it.

So, Joe.. From this end, nothing seperates you from the second class cops that permeate the force, and give the first rate ones a bad name.

Ever the Asshole that you are, Joe..

The guy probably really isnt even gay. He is just trying to rattle someones cage. I travel all over eastern US and hear people on the radio doing this. Once some trucker bites they usually say something like "I'm not really gay but sounds like you could be".If everyone leaves him alone and he will go away.

Hi Tim, long time since I have heard you on here. Last I heard you had a new kid. I got rid of my HTX-1000. Wife still has the tag# on her Jeep though. That was a wild coincidence. Finally tried switching the voltage on the USB pin on the processor. Takes care of the readout problem when you go to LSB. At least it seems too. I tried it on a dead radio that only the uP board was working on.Send me the mod as I would like to see what finally happened to it. I know one thing I did different on them was to lift the end of the resistor feeding the chokes instead of lifting the chokes. This kept the bypass caps closer to the end of the chokes. I had an instability problem in one radio that this cured.

The first radio I operated on was a big old Midland base radio (Can't recall the model). 1970's AM/SSB 40-channel radio (black in color) W/a PLL02A chip inside. It belonged to my father. What a great radio! It's still operable today, though not used any longer as of a few years ago. It was tuned up professionally and put out 11-watts dead-key when set on MAX. It never had the frequency expansion done, so it's stock other than the extra power output.

My next radio (which I officially owned) was a Cobra 148GTL. I bought it while I was on vacation from a truck stop back in '93 (my young age is showing here...I was 18 at the time) for about $185. I knew they were great radios, and just had to have it. Back then their were no local sources for any type of radio equipment, except for Radio Shack, and I didn't care to own something from them.

Since then I have purchased many radio and other items. For a fairly complete list, along with some more info about myself, stop by my CB page. Two links are provided within my signature below...

>Date: Wed, 15 September 1999 08:20 AM EDT

>OK Steve, you asked for it! Ill use just one example for the purposes of sparing bandwidth. Go out and purchase a Diamond, Comet or Larson antenna and dismantle any one of them.< (SNIP)

Still doesn't answer the question about products that deal solely to the Amateur market. BOTH of the manufacturers you cite also have antennas in the Commercial realm, and those antennas cost even more than their Amateur counterparts, although they are the exact same antenna.

>Look at that guy Fred Maia. If you go to his website, you'll see that he advertises that HE can get a person a Vanity callsign for $20, when in fact a person can fill out the form themselves and submit it to the FCC for $13<

The fact of the matter is Fred Maia is a Huckster and a SnakeOil Salesman in my opinion, but nonetheless, what he is doing is not illegal. Some people are willing to part with that few extras bucks to have someone else do the paperwork for them.

The FACT still remains that YOU have not made ANY valid point, and that in each case you try top present as any documnetary evidence is only further PROOF that we all have options AND the freedom to choose between Generic and Name Brand.

>(I just did this for a family member recently). Mr. Maia has recognized the fact that some Hams will pay more to him for this service. This is another short example.<

And some people will pay a delivery boy and extra $10 to run to the grocery store for them when they could do it themselves for free....and they don't even HAVE a Ham Radio license...so what? LOT'S of people will pay extra money to have something done FOR them just to say they did it. No big deal, Wildcat.

I ran a T.S modulator(one 2290) into a DX350 with good results(thats exactly half of your 500). I keyed up the modulator at 3 watts with a 80 watt swing into the dx350(two 2879s) and ended up with a 75 watt carrier and 500 watts of swing. I can tell you this: It sounded like 1kW.......... And yes it did take out all 40 channels with bleedover....

I guess you have underscored a very important point without realizing it. If your yield signs are Yellow, then a driver from this area may not know what it means, because they are red and white here in NW OH. Also, up in MI, in their turn lanes they have a flashing red light before the turn arrow. If you can safely make the turn, you can go. I'd never seen that before. It took several long honks and nasty stares to get the idea. I also understand that in some areas, traffic lights are mounted horizontally. Wouldn't that mess with someone who just figures if the top ones lit, stop, bottom means go!

He doesn't need to be licensed to operate in the CBRS. Also, the radio operator doesn't have to do anything more if he if running a legal, clean station. All consumer electronics have a statement on the back that basically says if you get interference from legitimate radio services, tough. AND, if your consumer appliance generates RFI (touch lamps, anyone?), you have to stop using it. A courteous operator will offer advice, and try to help, if he is approached nicely. Pin his coax, or damage his antenna, and he may not be as willing to help.

i have some transistors in a TO-5 case that I used to use in old CBs as finals. They required the addition of a heat sink to turn them inti a TO-39F style case. I have found that by placing two transistors in paralell that they will replace the MRF477(40 watts PEP on an HR2600). Unfortunately I have not been able to identify these transistors and only have a few left. Ive reachearched this as much as I can and cannot find anything in a TO-5 case that sounds like it would work. Any ideas guys what they could be. I used to have some transistors for repairing CATV amplfiers. This is the only thing I think they could be. These things would handle a watt or two with no heat sink.

>> Texas Star's are very trashy on the spectrum analyzer.<<

>Not on my Spec An. Your mileage may vary...As a matter of fact, the new Texas Star equipment was tested by an FCC lab!
Can you say that about any of the other manufacturers stuff out their?<

ANY Texas Star run on my Astron PS in my home will tear up everything in the house.

>And you are not running a Class C box, either. If you put a Class C box at >home, it will rip up your neighbors unless the rest of your install is >"Perfect!".

My reference to the X-Force X200, (1) 2sc2290 x (2) 2sc2879's is indeed class C, and the ONLY mobile box that has not interfered with the TV picture, TV speaker, stereo signal or speakers, and very faintly into a cordless phone. I was even able to use it to drive an Amp Supply LK500ZB 220v base amp with (2) 3-500z tubes, and the exact same results.

I currently use a X-Force XT400 (2) 2sc2290's x (4) 2sc2879's biased class B, it is also very clean, although does come over the cordless phone a bit more.

More than likely another hoax, here is the tipoff phrase, "Please copy
this information and e-mail
it to everyone in your address book." Just what the hoax is designed to
do, get everyone to send it to everyone else they know, advising them to
do the same and the only thing accomplished is a traffic jam on the
Internet. You will find this phrase or something similar in almost every
virus hoax.

Hmmm. So what happens if they're removed? I have a problem with my 2510 going into oscillation upon transmit. A Dejanews search mentioned removing these caps as a solution to the problem. I tried it (note: I know people who have removed the caps because they claim it gave them more swing; while I that isn't my intent I saw that it didn't immediately damage their radios so I was willing to try it,) and it has worked perfectly so far. But I'm wondering what other effects it's had on the radio. Any theories?

Thanks
Ben

OK, "Wildcat", I give......

What company caters exclusively to Hams?

If you are going to quote any of the current manufacturers of electronic equipment used by Radio Amateurs, CBers, or FRSers, you can save your time because I can disprove it before you get started.

Motorola....? Don't even go there!

Yaesu...? Commercial line known as "Vertex"

ICOM...? Commercial line under their own name

Kenwood...? One of the most prolific lines of commercial and EMS radios other than Big M and GE, not to mention their entertainment systems.

Henry? I used to date one of the original Henry's daughters. If it weren't for the commercial and military contracts, they would have dropped out of Amateur Radio 20 years ago.

Even such manufacturers as TenTec and MFJ have a commercial market for their products.

Care to try again?

Steve, K4YZ

2822. CB coupler or CB antenna

Hello all,

I'm a newbie in this newsgroup. In fact I'm new to CB. Does anyone know whether using a CB coupler (such as the paradynamics PDC133) to transmit/receive thru the car's FM antenna is as good as using an actual CB antenna? (I don't want another antenna sticking out on the car)

I'm also planning to hook up a RF amp to boost the power > 4W (i'm not using it here in the US). Will the CB-coupler/FM-antenna combination do the job?

Would appreciate any advice.

Thanks.

> OK, "Wildcat", I give......
>
> What company caters exclusively to Hams?

OK Steve, you asked for it! Ill use just one example for the purposes of sparing bandwidth. Go out and purchase a Diamond, Comet or Larson antenna and dismantle any one of them. Then go out and purchase a clone of these antennas or a CB antenna and do the same thing. Compare them. What you will find is there isn't any difference between the CB antenna (both in quality and design) and the Ham antenna, yet the Ham antenna is 200%-500% more money.

A prime example is the Antron 99 11 meter vertical dipole and the Diamond 5/10 (144/440 mhz) vertical base antenna. Both, when dismantled, are manufactured exactly the same way with the only thing being different is the resonant frequency of the antenna, yet the Diamond costs $190 and the Anton costs $40. Now, one can argue that the Antron is more cost effective for the manufacturer because of the demand vs. the number of units manufactured annually, however, there is still a very large discrepancy between the current price of the Diamond and the actual price based on the demand of the Diamond antenna. The Diamond antenna company knows full well that Hams will pay more for a Ham antenna as compared to a CBer paying for a CB antenna. This is only one instance.

Look at that guy Fred Maia. If you go to his website, you'll see that he advertises that HE can get a person a Vanity callsign for $20, when in fact a person can fill out the form themselves and submit it to the FCC for $13 (I just did this for a family member recently). Mr. Maia has recognized the fact that some Hams will pay more to him for this service. This is another short example.

You just correctly answered your own question. Thanks!

>
> And as far as any amplifier being legal, if that was true, the Henry 8K
> Ultra would be legal for shipment in the US, as would the Commander
> HF-2500E.

I don't know about those specific amplifiers, but I do know that there are more than a few "legal" ham amps that will do much more than the 1500 watt limit, if driven hard enough. There are no magic "watt limiters" that prevent them from going beyond 1500 watts. It's up to the responsibility of the ham to properly drive and monitor his output for conformity.

Ironically, most of the restrictions on ham amplifiers, revolve around their ease of being converted to 11 meter usage.

The FCC would also question the necessity of an amplifier that runs up to more than 10 KW, even though you are then barely tickling it at the 1.5 KW legal limit. But there are a few that will do 3, 4 and 5 KW and are legal. They just can't have 10 meters in them out of the box, and require at least a 50 watt drive to make full output, and cannot be RF keyed. There are more specific regulations, and I'm sure the FCC site has them if anyone wants to read them.

>
> I specifically know that neither of those amplifiers are legal for sale in
> the United States.

There may be one or 2 regulations that they fail and did not get approval. It may not be strictly their power output alone. If it has 10 meters in it, it can't be legally sold in the US.

>
> Also seems to me that somewhere I either read, or was told, that their is a
> cap as far as plate dissipation of an amplifier that would be marketed to
> the amateur community.

That may be true. But it is a bit above the 1.5 KW limit. Look at any
legal amp with a pair of 3-500z's. You know how much they are capable
off.

> It's
> a handful, and they'll go down. 14.313 is getting quieter every day.

No they wont. It will get worse and worse and worse to the point where the commercial interests will justify the 20 and 75 meter behavior as a means of taking bandwidth away from amateurs. When the ITU meets in a couple of years, what do you think will happen? Ill tell you what will happen, The Yeasu, Kenwood and Icom electronics lobbyists will successfully eliminate code to increase membership so the end result will be more radio sales. When this happens look out, because Riley Hollingsworth will need a team the size of the 141st Airborne division to police the airwaves, which they say; "Aint gonna happen".

What you are experiencing at present is the death-nell of amateur radio as you "knew it". You can blame your friends over in Newington, CT for this dilemma because they've been sitting on their hands for the past 20 years with regards to this issue. They have always been more worried about their dues income stream. Publicly they (The ARRL) oppose the elimination of code (to keep the old timers and Life Members happy), however internally they want it removed because they realize the potential of pulling in new members to add to their political lobby to appear as a growing organization as compared to a dying one which essentially makes them no different than the Icom, Yeasu and Kenwood lobbyists. Hell, even the government abandoned enforcement 12 years ago because even they recognized that the amateur base was shrinking.

If you think that what's going on right now is the beginning of "better times" in amateur radio, I truly pity you.....it has gotten progressively worse over the past 25 years and it will continue to do so.

Date: 1999-09-15 00:00:00 UTC
From: Woody <cbgazett@insync.net>
Message-ID: <uhND3.4034$C3.30497@insync>
Source record: 2839

Been updating the site.....

http://www.cbgazette.com/gaz2.html

Updates are:

Auction Pricing (new item)
Equipment reviews (2 additions)
Radio Photo's (10+ additions)
"Virtual Henshaws" (new item under Classic Ad's) [work in progress]

Regards,
Woody

2840. Palomar 225 AMP - Any Good?

Newsgroup: rec.radio.cb
Date: 1999-09-15 00:00:00 UTC
From: djenn@ev1.net
Message-ID: <k7OD3.9182$C%.6553857@WReNphoon3>
Source record: 2840

Hi, I'm looking to buy an amplifier and see that Left Coast Radio has a Palomar 225 on sale for $99. Has anyone used this amp? Recommendations? Any other amps in this price range? I need to stay below $150.

I use a Uniden Grant XL and want this amp for both AM and SSB.

I wonder if aluminium wrap in several layers in maybe a two square feet
pattern would work with the magnet antenna.

> 1500 watt limit, if driven hard enough.

And a lot out their that will do it with less than my Kenwood puts out. I
have seen nearly 8 grand out of the Commander HF2500E with my Kenwood
driving it. It is a 3 tuber, export only.

Being designated as an export amplifier means that it ships with 10 meters,
but that is not why it is designated as an export amp. It reaches full
legal limit at about 20 watts PEP drive.

That makes it illegal, but do you think that they could not put a small
resistive padder in the circuit if they knew that the FCC would approve it
otherwise?

There are no magic "watt
> limiters" that prevent them from going beyond 1500 watts.

Sure their is! It is called ALC, but it is also up to the amateur op to
make sure that he is running effective alc.

I agree to your point, but ALC was designed to help the amateur keep power
at a safe, legal level.

It's up to the
> responsibility of the ham to properly drive and monitor his output for

> conformity.

I agree!

>
> Ironically, most of the restrictions on ham amplifiers, revolve around
> their ease of being converted to 11 meter usage.

That, and drive power, as well as not being able to hit monster power
numbers.

>
> The FCC would also question the necessity of an amplifier that runs up
> to more than 10 KW, even though you are then barely tickling it at the
> 1.5 KW legal limit. But there are a few that will do 3, 4 and 5 KW and

Just barely legal.

They just can't have 10 meters in them out of the box, and

Dave,

If I remember, the amateur amplifier may not have dissipation capable of
greater than the 2Kw input level that was the legal benchmark of yesteryear.

I will look around and see if I can dig that up.

I can tell you all this.
Their are guys like that everywhere my compny travels, including several around the home area around Philly.
There is a guy I hear quite often that says," I got my nightgown on, I got my pretty red panties on and I'm ready to go to bed."
We try to ignore him but now my drivers are hearing him (or someone like him) nationwide.
He's almost as funny as the guy that is right here close to my base area that is constantly immitatating the character out of the old truckers song " CB Savage" always asking, " Got any Smokey Bears out there; how 'bout any bare Smokeys?"
They are relatively harmless as well as relatively humorous so leave them alone and find out who the " Radio Rambos" are that come into your towns and immediately want to find the local bases and harass the living hell out of them and always try to find some poor fool willing enough to try to find them so they can kick that fool's ass.
Hell, I even get on 19 and a few other channels and have a little good clean fun when I imitate "Ol' Vern Johnson" the redneck with no electricity but has a pedal powered generator that makes his radio put out more watts the faster his wife can pedal it. Sometimes I even live an entire evening as Vern giving everyone on the local base channels pains in the sides from laughing so hard and long. They enjoy it so much around here that Vern has actually become friends with some of the locals.
Thanks for reading my post and have a great day.....
Oh, by the way, if you're ever in the area jump on 19, 24 or 15 and give "Ol' Vern" or his wife "Vernadette Johnson" a shout I'm very sure they and you will enjoy the chat.

I have both.... I use the regular head for AM. It has a higher pitched
Clearer sound that is much louder. the 10 DAL head is less sensitive
and has a lower pitched sound to it. I really don't like the 10 Dal
head at all. The guys like it on SSB so I use it. After all i don't
have to listen to my radio. They do.....

The Sweet Sixteen with a one pill modulator doing 125 or so watts will peak
at close to 1.4 kilowatts.

You need to use something like a 250 to get anymore than that out of it.

2858. Re: HR 2510 Max Output ?

Newsgroup: rec.radio.cb
Date: 1999-09-15 00:00:00 UTC
From: MC Turner <C_Turner@ix.netcom.com>
Message-ID: <37E01D41.51EE0C5D@ix.netcom.com>
Source record: 2858

I have worked on many 2510's. Most 2510s will do an honest 35-40 watts peak on AM from a 10 watt carrier. The thing to remember is to keep that carrier under 10 watts of you want the finals to last. It is not so much the peak power to worry about. Dead keying that radio at 15-20 watts will kill the final.

I have the Transmitter and the Receiver. Condition is good. All
original knobs and it looks good no extra holes. The transmitter works
fine but the receiver may need a tube, audio quit, all other functions
like S-meter and all controls work. These are rare and collectable
radios at a regular price.
I want $200 + shipping for both pieces.

2860. Re: CB coupler or CB antenna

Newsgroup: rec.radio.cb
Date: 1999-09-15 00:00:00 UTC
From: pllo2a@aol.com
Message-ID: <19990915184726.01591.00000751@ng-cr1.aol.com>
Source record: 2860

if you use an amp on one of these couplers, you will probably be smelling
something foul comming out of the coupler, matchbox, your amp and probably your
dash board broadcast radio. they arn't made to take any real power at all.
these are no more than a radiating dummy load, (a piece of test equipment that
shouldn't radiate, not an insult to you), and of no real value for anyone
that's the least serious about cb.
this is not an admonition to you but these and the through the glass cb
antennas really bug me and, in my opinion, are a big waste of good money but
the corperate types don't care about these things.
the only thing that these antennas look good to is your final transistor at or
below 5 watts. as far as performance, they are junk.
i'm NOT a cb god but this is my opinion and i hate to see anyone throw away
money on these things.
good luck
jeff

You sir are dead wrong. You are probably one of the guys with the"I can run 32 pills on my factory alternator" attitudes, you yourself said factory volts. buy your self a real peak meter and do the right things to the amp and then reply. It takes an alt that has the ass to keep up. this is not something you have "rewound" at Joes alternator and starter!!!!

MR-ASS
Got Down!!!!!!!!!!!!

To whom it may concern........

A single 2SC2879 will produce 180 watts pep....
8 of them will produce: 8 x 180 = 1440 watts
with a power supply holding at 14.4 volts
and 30 watts of drive. (peak modulated power
output, not dead key)

Hello Steve & Stephanie:

Yes the MC11 and MC11A where great radios, and yes they where made in Burbank Ca, on Burbank Blvd, near Hollywood Way. Nobody responded, probably because everybody else also wants one. Keep an eye on the CB Radio section of E-bay.

The plug on the back of the radio would up the carrier output power, at the expense of losing a little audio. Some of the old timers that use to call the Super MC11A's Junkie Generals, use to wire in a power resistor in the plug wiring allowing the radio to not be too strapped, and still have good audio qualities.

The General Radio Telephone Wattmeters, Model 615, came in versions A, B, & C would read pretty high, as compared to a Bird wattmeter. Maybe this sold a few radios also.

General Radiotelephone also made a MC12, that had a much more powerful modulator, as compared to the MC11A radios. The new modulator in the MC12's used a pair of large tubes for the modulator, where as the MC11 radios used a impossible to get German tube. General also made a very rare SSB CB Radio, called the SB-72. The SB-72 never got off the ground, due to oscillator problems.

Jay in the Mojave

> counterparts, although they are the exact same antenna.

OK, please post Diamonds CB antenna Line for us. You cant because they dont have one. Diamond, like many other manufacturers does not want to cater to CBers because they know CBers wont pay but Hams will. The same goes with Cushcraft, Hygain, and just about every other Ham oriented manufacturer that once had CB lines, of which all of them abandoned their CB products because of the justification of cost. If you're only 30 or less you wont remember.

Keyton,

The only radio in the Soundtracker Series
that is worth having is the 148gtlst. It is
the only chinese built radio of the bunch in
which the soundtracker "circuit" operates as
advertised. If you want to experience receiver
blasting from nearby stations and reduced power
output from the transmitter in a soundtracker
radio, buy any of the am models and that is
exactly what you will get!

Jack

P.S. Want to make a wise investment? If you
don't need a sideband radio just buy the Uniden
PC76XL/? and you will be money ahead. You may
email me if you would like further information!

I've got a MAXON MCB-30 with a Wilson Ant. in my Jeep and I'm trying to squeeze a little more power out of it. I saw on Bernie's CB web site that there were some adjustments that could be made to my radio. Under the tips and tricks section this is what was listed: RV-1 Squelch Range Adj., RV-2 Modulation and CT1 10.240xtal Adj. There was also a modulation mod; it said to remove or adjust C421. I'm not real familiar with audio circuitry. Can someone help me out here? I now know what to adjust, but how?

I have recently gotten an HH45WXST and used it on a trip through California. First off, the ST can be turned off -- no problem. Push a button and it's off -- push the button and it's on. The ST function on my radio worked extremely well. Overall, the signal to noise ratio was noticeably improved. There was no loss in transmit power and reception was excellent.

I really like this radio -- if you want a Hand Held I'd definitely give it a try. In addition it supports a wide variety of accessories that really enhance its usability. It's very compact with excellent sound.

I've been using CB's of various shapes, sizes and types (no SSB) for about 22 years -- so my thoughts are that while ST isn't an earth-shattering, revolutionary, got to have at all costs feature, ST does perform exactly as advertised -- try it. I didn't find that it cost any extra either -- I like it.

Regards,
Eric

Not that anyone here on the CB newsgroup gives a shit,

But, with 100 watts into a 20 foot piece of wire, I just QSOed with
Louisianna and Arkansas from Houston.

The SWR was horrendous, but the antenna tuner somewhat made up for it.

20 feet of wire on 80 meters... That would be like a 2 foot antenna on CB.

Not inside they're not!

The Adams is an older design and works reasonably well although I have found them to be a little deaf. The audio IC used in the Adams is obsolete and practically impossible to obtain - somewhat worrying as they fail from time to time. Some techs fit a crosswired TA7205 but this doesn't last long.

The Adams scan circuit can be modified to check channels other than 9 and 19 by modifying the diode matrix - details in one of Lou Franklin's books.

>(without the dyslexia).

Although we disagree on other issues, you are right on the money with this one.
An even better comparison is Cushcraft. Back before the government do-gooders
banned the sale of metal CB antennas, Cushcraft marketed a "Ringo" CB antenna.
It was a vertical half-wave, 3.75db gain, and sold for around $35. The SAME
EXACT antenna was marketed to hams as a 10-meter vertical and sold for $55-60!

In fact, the same thing occurs today with the Solarcon A-99. Copper sells it
as a CB antenna for $39.99. AES sells it as a 10m antenna for $64.99. Which
would you choose?

Yes, I ordered the GE radio and a multitool kit. They were here quicker than I could imagine. The company has just gone through a major change and a move but still maintained business. I haven't received my rebates yet but am confident I will. They tell you flat out that it can take several months so be prepared to wait. The company that makes the multitool kit that I orderd was really great with customer support. They are sending me a warranty replacement laser pointer. Mine had a hairline crack in the barrel. No questions asked, and very quick to respond. The multitool and knives that were part of it were not Victorinox or Gerber quality but they were a quality stainless steel and quite useful.

The radio is cetainly not like my cherokee but still a good performer. Just doesn't have the bells and whistles. You can't charge nicads in it. I use 8 alkalines. It is bulky. It has a screw on antennae and it is almost impossible to get a bnc adapter to use a different antennae. On the brighter side it has a hi-lo power. Performs like any handheld. Has a nice led display. Nicely shaped control knobs. Actually they are oval and not round. This is rather unique. The audio is quite clear and crisp.

There are a ton of them for sale on e-bay and some selling quite high. I wouldn't part with mine. If someone didn't want the hassle of the rebate I'm sure they could find one on the newsgroup or any auction site for 20 or 30 dollars. Even that is a pretty good price for a brand new plain jane handheld.

Before I ordered mine I asked the same question, if anybody received the rebate yet and had no response. Figured if I wait forever they will be gone. I will post it when I get my rebates.

Took the plunge, crossing my fingers, and patiently waiting for my rebates,
Rick B.

2920. Antenna questions

Newsgroup: rec.radio.cb
Date: 1999-09-16 00:00:00 UTC
From: "R.J." <rjmcman@nb.net>
Message-ID: <Qa%D3.395$MG.2254@newsfeed.slurp.net>
Source record: 2920

I have a few questions regarding antennas. First off is there an antenna available for use over a super wideband? Say from 23-31 Mhz, mobile or base? I understand that antennas are built to have a sweet spot, but just how big can this sweet spot be?
This question is about SWR, particularly mobile. Most people have a reading that is high (1.4:1) on the ends of 11 meter, and low (1.1:1) in the middle. Others have a perfectly flat reading 1.4:1 across the board, but can't get it lower than that. As an example lets say it's the same antenna, different car, but similar mounting; say a Ford van and a Chevy van, Wilson 1000 mag mounts in the middle of the roof, and even same radios. Why such different SWR readings?

You are seeing nearly 1300 watts input to the tubes.

And at 550 output, this means that you are reaching the FULL dissipation of those tubes. Dangerous place to be.

Sounds more like the amplifier is not being tuned correctly.

Wait.. What meter are you using? Is it a PEP reading meter, or an averageing type meter? For a PEP meter, you are WAY low. For a AVG meter, you would be on par.

If you convert to 220, the lights shouldn't dim in the house. You will typically see a couple hundred watts extra if sag is a problem (like it seems if you are seeing the house lights dim).

I am also interested in what your plate voltage is like when you whistle, vs at rest.

==========
The talk back should not be operational when the echo is off. The
radio is covered by a 2 year factory warranty, so you should send it
back where you got it, or to Galaxy for repair/exchange.
This is why we test, align and tune every 10 meter and export radio
before we ship them, so the customer won't have to go through the
hassle and expense of returning a defective radio.
Galaxy radios are usually quite reliable, but like anything else made
by man, you can get a bad unit on occasion. The Galaxy factory
service people will treat you right.

Difference in size of vehicle and amount of metal it is attached to.
Some vans(new ones) are Fiber glassed roofs.

I have the following Radio, and electronic equipment for sale. Will consider trades for Hand held Scanners with full 800 coverage. All Gear working last time tested unless noted. Shipping is extra. Please reply to my email address. Thanks
EJ (KC5EPI)

All Tube Items:

Tempo-1: All Tube Ham Transceiver with Power Supply. Covers 80-10 meters. Looks good and works well. $200

Pearce Simpson: Guardian 23- All tube CB Transceiver/with mobile power cord and mounting bracket. Looks and works Good. $100

Channel Master: Tube Stereo Receiver (Model 6612) and matching amp (Model 6601) Looks good and plays on FM only. AM not working. $100

Non Tube Items:

HTX-202: Radio Shack 2 Meter HT. Works good. Slightly chipped where the battery slides in, but does not affect operation. No nicad, but I will include the AA Battery pack with the unit. $80

Marantz Model 2220B: 25 year old Stereophonic Receiver, with gyro-touch tuning, blue dial and optional real wood case. This unit is in excellent condition, both in looks and operation I would rate a 9.7. Also have original manual, in excellent condition. $200

AR Inc: Stereo Amp, All solid state. $100

Traynor: Group Two B- Audio Amp Head. High/ Low misc. in puts. Master volume, volume, bass, treble and tone shaper controls. All solid state $125

Swan 14X DC Power Supply Module: No way to test but was told it was working OK. As is $50.

Siltronix Model 90-6 VFO: Excellent condition with three position crystal switch $75.

PRO 2003 Scanner: Radio Shack 50 channel(30-512 Mhz.) Digital Scanner with FM broadcast band included. Have two, one is working the other is a complete non working unit. $150 for both.

Bearcat 250 Scanner: Have two. One working at times and one for parts. $50 for both.

You could build a gamma matched antenna that would be much more broad, but it is best suited for stationary use, not mobile. SWR is affected by many factors including the shape and size of the vehicle, where the antenna is mounted, and also if there are other objects nearby which can affect the reflectivity of the antenna. To compare, you would be better off trying to do so in clear open space.

I started my wallet-killing, salary-burning radio hobby back in 1981. My first rig was a Palomar Skipper Model 73... It was an old tube type 23 channel SSB rig... When I got it, the gentleman that sold it to me threw in a Sam's PhotoFact Volume 59 that covered the radio!!! Everyone I talked to said that it sounded great, and wanted to know if I wanted to sell it... I never did.
I still have that radio to this day, and i still use it once in a while... It's an oldie but a goodie!!!!

>So what was your FIRST RIG ?

it seems to me that people would be concerned with how many average watts there
doing instead of peak. on am your talk power comes from the average not the
peak. i guess those people just like to watch it swing and believe they got
more than they do.

>

the main problem with cb is everybody wants to do there own thing so theres no collective voice. if you really wanted to get things going join forces with one of the well known cb rings and the overall people visiting your site will increase and more people will see the info you want them too. no matter what you do here the cb is not gonna go back like it was. remember all things change with time and the cb is no different. even if we went to being all legal. how are we gonna talk when during the day theres a full scale noise level on all 40 channels? the dx is what killed the cb boom last time and hopefully enough people have extra channels now that they will be able to escape some noise and keep using the radio.

The storm at present (9:30 am EDT, Thursday) has weakened to 90 MPH winds. By the time its gets up to the NYC and New England area, the winds will be well below that speed. Probably 85 MPH gusts and an actual wind speed of 65 MPH +/-. Your beam should be fine.

I was going to take mine down but I decided against it, so; "Thar she blows".

I've been monitoring a few local 2 meter repeaters in the New England area and all of the GI Joe Wanna Be's are out in full force. Here's what some of these guys are saying and doing:

They are actually using words like "that's affirmative" instead using of the word "yes".

Saying 0700 instead of 7 o'clock.

Calling their club meeting house the "Command Center".

Instead of saying "Can we send a couple to guys over to the Hospital for a pickup?", they're saying "Can we mobilize several units to MED 1 for a transport".

Most of these guys are feeling the need to report every 5 minutes in what direction the clouds are moving and what color the sky is. So far this morning I've heard that the sky in the same location, at the same time was 7 different shades of gray.

Two guys were actually arguing about which one of them was actually the "Incident Command Team Leader"

One guy is pissed off that he took the day out of work to get his mobile tower trailer ready, and that there's a good chance that we might not even get the storm.

And finally, one Ham is leaving his home for his club headquarters 12 hours before the storm might hit because he's afraid the storm might hit and he'll be trapped with his wife with no utilities for 5 days. ;-)

I've explained it a million times and they still don't get it. I enjoy both
ham and CB. Plus scanners, shortwave listening, broadcast band DX'ing, etc.
My beef is with blatantly illegal operators of all types who cause chaos and
make the spectrum unusable for others because of their unlawful activities.

A review of my posting history will show that I have been just as critical of
hams who run their Henrys wide-open on 75m and jam each other as I have been of
CBers who run multi-alternator, mega-wattage stations in their cars and wipe
out the entire band.

That is the problem.

You are seeing what you should, if those are AM numbers.

That equates to 1200 - 1400 watts PEP output, so you are fine, although I would keep the carrier power down to about 300 watts at that level. That should make those tubes last a good long time.

For future knowlege, you can replace the tubes with 3-500Zs and get about 2 grand out of it. Nice to know after you bought the tubes.

The Swan meter is an averaging type of meter, as far as I know.

No, a license is no longer required to work on this crap.

BTW,
> they are Dits and Dahs, not dots and dashes

That is up to the interpretation of the person talking.

I have heard them called both, depending on the person speaking.

Other than that, it is a question of semantics.

RE: emergency communications.
there are no power, license or frequency restrictions to anyone if it involves a threat to life or substantial property damage.
if you are on a deserted road and you see a cop unconsious on the ground and you get on his radio, all you will get is a big thank you.
i have a friend who lived near the coast guard station at the st petersburg / clearwater international airport here in florida who picked up a distress call on 27.585 from a Swiss flagged vessel in the atlantic off the coast of the bahamahs.
he called the coast guard and was asked BY THE COAST GUARD to stay in contact with the boat by radio and with them by phone.
he did and the people were saved.
he also has a certificate of gratitude from the Swiss embasy hanging on his wall and NEVER heard a word from the fcc for TALKING ON AN OUT-BAND CHANNEL WITH A MODIFIED RANGER AR- 3300 AND A 100 WATT BASE LINEAR ON L.S.B.
my guess is that the Swiss would have came to his defense anyway and it would have looked bad for the fcc in the news papers. i could see it now:
MAN FINED FOR SAVING LIVES OF FOREIGN MARINERS!!!.

However, I do know of someone in San Diego County who was involved in a bicycle accident (Mountain Biking in the Laguna Mountains).

His friend fell and cracked his head open on a rock. He used his modified 2 meter radio to call for help on the Sherriffs TAC repeater.

They flew lifeflight in, his friend was saved, and he lost his radio as well as his license for a period of time.

Moral of this story...

Although the law states that you can run wherever you want in an emergency, the Lord (FCC) giveth, as well as taketh away!

I operate almost exclusively CW and work a lot of traffic nets. The use of these codes is invaluable. My personal opinion is that their use should be limited to CW and HF-DX SSB. Saying QSL on 2 meters or 11 meters (local) doesn't serve much of a purpose.

Hi all,

I don't know much about electronics, so I need help from you, the professionals. I have a 20 year old Teaberry 23 channel C.B. in my VW bus, and I can hear the engine rpm when receiving transmissions. I assume I need a noise suppressor of some sort, but what kind? I'm limited to stuff I can get at Radio Shack. Any suggestions?

Also, I've been told I can "tune" my C.B. antenna for better reception. How do I do that? It's a magnetic base type, again from Radio Shack.

Please respond via e-mail, because I'm not sure if I'll be able to find this newsgroup again. Thanx in advance,

James

Ok let me take a stab at this......

"R.J." wrote:

> I have a few questions regarding antennas. First off is there an
> antenna available for use over a super wideband? Say from 23-31 Mhz, mobile
> or base?

For the Base, I would choose an antenna that has a gamma match. The Sigma 4 that I have comes to mind. The Sigma 4 is 3/4 long and is 32 feet long from tip to mount pipe. It is a very broad band antenna. In fact I had to use a 60 CH band spread and a modified export radio to be able to "see" the curve on either end. Mine is total flat in over the entire 40 ch band and rises only to 1.2:1 on CH60 and -20 I have never taken it farther than that so I don't know what the limits will be. I consider usable to be up to 2.0:1 with a low power radio. Add a good Antenna matcher and I bet you could get most of the freqs you want under 1.5:1...
For the mobile forget the Wilson's and most high gain antenna's. They are high Q antenna's. This means that they are designed to work better than most antenna's on a smaller band spread so they have more gain. In other words they work good over a small area but fall short in the band spread. Most Key down type antenna's are low Q antenna's. I/E Two watt, Muddy waters and DR. Crow. They are very broad banded antenna's. This is why the Reflected power usually drops allot when you use one. They are able to radiate more of the Dirty overdriven RF signal we get out of Comp style Class C battle boxes. Was this designed into the antenna? I don't think so.(ok, go ahead and insert arguments here guys..) I think it was a total accident. I hear people talking about how flat they tuned there comp style antenna's all the time. it is actually easy to do! Most don't have much gain at all. They handle loads of power and produce good results in the reflected power dept. so people run them. Most of the guys are running so much power that it makes up for the lack of gain you ge with an antenna like that so they don't notice. Just last week we saw this first hand. A friend has a van with 1500 watts of Xforce power. He switched out three antennas from a distance of 30 miles from my base. One of the antennas was his normal comp style antenna. the others ones where a Wilson 5000 trucker(highQ) and a $14 Francis fiber glass stick. Guess what? The lowest performer was the Comp style antenna! It has the best match and the lowest reflected power also... Next was the wilson 5000 trucker. A slight improvement over the Comp antenna. The winner: The $14 Francis. It had a lightly higher reflected power than both but it clearly got out better. I was worried about the power handling capability of the Francis but it ran ice cold with the 1500 watts. Wow a $14 antenna that beats two $100 antennas.. Oh and in case your wondering it was only a 5 foot Francis.
I would pick the longest key down style antenna with the largest diameter radiator that I could find for you purpose of the large coverage you desire. You

will still need an antenna matcher to get the kind of coverage you want.

> I understand that antennas are built to have a sweet spot, but
> just how big can this sweet spot be?

The lower the Q and generally the longer/larger the antenna the larger the sweet spot.

>
> This question is about SWR, particularly mobile. Most people have a
> reading that is high (1.4:1)

That's not high. 2.0:1 should be you limit not 1.4:1. you would never notice the difference in most case unless the test was controlled.

> on the ends of 11 meter, and low (1.1:1) in the
> middle. Others have a perfectly flat reading 1.4:1 across the board,

Mis tuned Low Q antenna. Or not enough ground plane and or bad ground with a low Q antenna. Another possibility is the radio that was used is dirty. I have seen Radios effect SWR Many times this way. A clean radio will produce allot of 27 MHZ signal and very little on t he harmonics. A dirty radio will produce allot of harmonics. This reminds me of a friends Sears Road talker 40. That damn radio is one of the loudest I have ever heard. With a few mods and a stock mic it is unpleasantly loud. My friend was trying to get his SWR's down but no matter what he did they would not drop. We changed radios out and he found that he had very little reflected power and a very good SWR. The antenna could simply not radiate the amplified harmonics that his Radio/amp where producing. This showed up as reflected power and SWR. I hooked the Sears up to a Spec analyzer and found huge spurs on the second and third harmonics as well as everywhere else! radios do effect the readings of SWR meters and reflected power watt meters.

> but
> can't get it lower than that. As an example lets say it's the same antenna,
> different car, but similar mounting; say a Ford van and a Chevy van, Wilson
> 1000 mag mounts in the middle of the roof, and even same radios. Why such
> different SWR readings?

Ground plane. The different vehicles might have different Ground planes to work with. Also you said mag mount. Mag mounts get there ground through the magnet.. One of the Vans might have a thicker gauge of metal on the roof than the other. It is also possible that one van may have many coats of paint. This would insulate the Metal from the mag mount to some degree. I have seen cases where a van might have a metal brace under the top. Moving the mag mount a few inches has changed SWR. I would expect the antenna to tune pretty flat on both Vans across the 40 CH band if setup right.
I hope this helps you understand antenna's more. Now for the arguments!!

I'm a HAM (KB5UGJ), but my new job has me traveling over the road
3500-3800 miles a MONTH!

I'm looking for a CB rig to put in my mobile for these trips.

What suggestions does everyone have for a good (or the best) unit to
get?

I'll be mounting it right next to my VHF/UHF (2m/70cm) rig.

Thanks and Later Daze

> Only every post made....Including this one.

Gees Steve, It sounds like your a legend in your own mind.

> You continue to make accusations that are obviously a fallicy to
everyone
> else here. Your credibility is about zilch point squat.

A fallicy huh.....I love old trolls with new names. Let me clarify my "fallicies" for you Steve because you're obviously NOT comprehending something here;

An Antron 99 is $40 - A Diamond 5/10 is $190, which is a 470% price gain for an identical antenna (except for the frequency) THIS IS WHAT I ORIGINALLY POSTED, If you go back and actually read the posts, you may become enlightened.

A Wilson 1000 magnet mount mobile is $59 - A Larson 2 meter/ 440 maget mount is $132, which is a 200% price gain for an identical antenna (except for the frequency)

A Paradynamics 10-C SWR meter is $39 - The Diawa clone HF SWR meter is $105, which is a 269% price gain for the identical product.

I can name about 4 dozen more FALLACIES which come to mind without even looking for them.

How old are you anyway? My god cant you do basic mathematics, or at the very least, look at catalogs to compare prices.

> I disproved your assertion with verifyable facts.

Verifiable with who? Only you.

> attacks...very professional. I am sure your Mom
> is proud of you.

Wow Steve, is that the best you can do?

>
> If you use the reference to the A99 (about $40 per your quote) and
it's
> "amateur" price of about $70, that's STILL not "500%". That's only
175%...not
> even close to your assertion. And NOT an unreasonable difference between
> retail dealers.

Hello out there.......are you on an ARES net somewhere? The comparison WAS
between the Antron 99 and the Diamond 5/10.

Steve Im glad to see you've got a new screen name however the new skill you
should be aquiring is learning how to read because you obviously mastered
that skill yet.

Hi all,

I believe that most of you know that Palco Electronics is the exclusive world wide Distributor of the Bulldog Meter. The Bulldog Meter is being built better than ever and is also selling better than ever before. People really like this meter and I am constantly being given compliments about this particular product that we sell.

Dave hit the nail right on the head with his posting. I and many other people find Carl to be exactly as Dave described him to be. Carl is honest, truthful and an extremely talented person. His integrity does not allow people to shout obscenities at him, he would just as soon hang up on that person and let it go at that.

It depends on what you want to do. If your looking to just monitor the highway any of the Unidens would be a good choice. The 66 or newer 68 is a good performer with a fairly small foot print. If your looking to try to use SSB or go to the outer channels the Rangers, Galaxies or the Uniden Grant with the channels expanded would be good. These are all bigger radios and you didn't mention what your vehicle was. A Wilson 1000 would be a good choice for antenna. I have used a Lil Wil on the highway with good results in highway communications.

I used one for years and found it to be a good little amp.
I heard this; someone I know; etc.. doesn't quite answer the man's
question, now does it?

Jeff

I agree completely.

I hate it when misinformed people try to answer tech questions.
All they do is perpetuate misconceptions.

The Blue Face 225 is a great entry level amp that's being sold at a
price that's so low it's scary. The deal is so good that it's a
no-brainer.

ThUg LiFe wrote in message
<24652-37DFE50A-39@newsd-243.iap.bryant.webtv.net>...
David,
The old sayig goes "You get what you pay for" that is ever so
true
with the radio. Me personally have never ran the 225, but from
what I
hear from MANY people they are junk.#1 they are MASS produced,
that for
one shows that the quality would be less desireable. Now a
question for
you. Why would you want to run an amp on AM? #1 You will be
breaking the
law, #2 your neighbors will more then lkely hate you for the RFI.
Now
I'm not gonna' nit pic here at that cuz I have used an amp a time
or 2
so I'm no hipacrit (how ever you spell it) In my opinion
David...try for
a Texas Star or a DaveMade. You mght pay a lil more..but I can
assure
you that you won't have too much problems with it. (as long as
it's
hooked up right of coure) Good Luck
73's

> whats the dead key you use?

The equation is simple. Peak divided by 4 equals average (aka RMS).
If he's seeing 200 peak watts, then the maximum deadkey that won't
result in backswing with modulation is 50 (using a scope). Using a
Bird, it's the peak divided by 3 equals the RMS figure. In this case,
using a Bird, the RMS wattage is 67.

If you want more info, go to my website and enjoy the AM tutorial.

>
>Then drop the QRT and say something like: "409 standing by"

Again, these codes are generally for CW use. When a station wishes the other station to "Stand by" they will send the prosign AS DiDahDiDiDit as one sound. If they are going to close the station and not stand by (on their end) they will send CL at the end of the transmission meaning "Station Closed", otherwise it is presumed that they will continue to receive traffic or calls from other stations. (IOWs, be standing by)

Generally QRT is used in conjunction with a phrase. Example: Must QRT for dinner or Must QRT for school, etc. This means "I must stop sending now, I have to eat dinner" and so on.

Hope all this has helped clear up this QRT thingy :-))

Regards,

Arnie -

> not interested in peak readings.

The 225 will do more than that in an average installation.
Since the 225 draws very little power, the supply voltage
doesn't droop. That means the supply voltage under-load
to the 225 will be between 13.8 and 14.5 volts.

Given that, the peak wattage will be in the 120 to 150
range MINIMUM. Divide that by 3 to get the RMS wattage
using a Bird.

In many cases, the high under-load supply voltage will
result in peak wattages that are in the 180 to 225 range.
Divide that by 3 to see the RMS wattage as shown using a
Bird (60 to 75).

In any case, your 30 watt figure is unrealistically low.

2991. Steve, the moron who can't dance...

Newsgroup: rec.radio.cb
Date: 1999-09-16 00:00:00 UTC
From: Toll Free <tollfree@bigradios.com>
Message-ID: <uqiE3.5558$C3.34662@insync>
Source record: 3035

UPON WHICH PUBLICALLY ACCESSIBLE RESOURCE ARE YOU AND WINDY ONE MAKING THE ALLEGATION THAT AMATEUR RADIO EQUIPMENT IS PRICED UNREASONABLY?

It's a simple question, so I imagine simple minds should be able to answer
it!

Got **YOUR** dancing shoes on, Toll?

Steve Robeson

The Antron 99 at Copper:
http://www.copper.com/online/box.cgi?name=A65-00002&add=Add+To+Order 37.99

The Antron 99 at AES http://www.aesham.com/sol.shtml 64.95

Steve,

Do you need anything else.

No, I am not taking my ball and going home. You seem to forget that I was the person who said that I was not responding any longer... Then, you put up a challenge, which I have answered.

You seem to be the person (who, to this day still hasn't) been able to substantiate anything he says, either.

Please see below for my answers to your rediculous diatribe.

>Subject: Re: Local Radio Operator Questioned by Police
>From: "Toll Free" tollfree@bigradios.com
>Date: Thu, 16 September 1999 05:21 PM EDT
>Message-id: <NhdE3.5524$C3.34020@insync>

>Funny.... You completely dance around the subject at hand, but seem to think
that the rest of the newsgroup is fixated around the 500% claim.<

(1) There is NO dancing around ANYTHING, Toll. Windy asserts a 500% inflation in the price of communications accessories sold to hams vs CBers, and
I say he's full of it. And I proved it.

>>>Where? I didn't see it anywhere? Seems to me that you said "That isn't true". I see in another portion of the thread where Wildcat reiterates his claims (yet again). I have yet to see you post to it, so I can only guess that you haven't seen it yet. Other than that, I have agreed with you that the inflation number is high, but I agree with him that it does exist.

Or, are you going to tell us that the aluminum used in an amateur antenna warrants a higher price because it is of higher quality aluminum than the same material when they put it to use in the commercial or amateur field?

(2) I have no idea what the "rest of the newsgroup" is fixated on, nor do
I care. If they wish to participate, they may do so. If they don't, relief is
just a mouseclick away. So far though, it's just you, Windy and I.

>>>>Oh, I believe that I do. I have been around a lot longer than most any other person on this group, and I would tend to say that they are all tired of you making an idiot out of yourself and keeping the thread going.

On the other hand... I guess we all need a good laugh, and now that Chuckie has a job and has become (no offense to you, Chuck....) a productive member of society, we can all look forward to your backwards thinking posts.

After all, the thought process is the same.... You just use cleaner language!

>100 percent price difference is an OK difference just because of different dealers?<

And I guess you have never paid $1.00 for a small Coke at a concession stand in an amusement park or $2.50 for a draft beer at "the game"? Come on!...The market will bear what the consumer is willing to pay! And if someone
is willing to part with $500 to $1000 without shopping around for the best deal, well, the old addage about a fool and his money being parted is true.

>>>But, AES, HRO, and most of the other "Cater to hams" stores all seem to sell the Antron (since it has been used as the reference for a while) at about the same price, but when you look at a CB (supposedly, although it seems the boys in Ky are looking to branch out) shop, the same items are less...

I have noticed it with the Maco products, too...

Call Joe Gunn and ask them for the two different catalogs... The same antenna is higher when you look at the 10 meter versions. Same construction, but higher price!

>This is a real issue, and as far as I know, the ENTIRE issue? While Wildcat
did make a rediculous claim of 500%, you have continued to skirt the issue that he brought up with it, and the price fixing that happens among the amateur
Vs CB market.<

Toll, are you on drugs?

>>>>No. You must be... The simple truth is their, and it seems something is fogging your vision. That, or you are a dunce.

Price fixing?!?! HAH!

>>>>I used the word as a metaphor. Still, seems funny that the Antron at a store that caters to amateur ops is higher than at the same type of store that caters to CBers...

What would you care to call it? I also seem to remember a case a couple years back about some pharmecuetical companies that had the same problem... They where fined for price fixing.

Guess my metaphor was right on, anyway. Need a dictionary?

I can pick up any CQ or QST and spend an hour on the phone getting quotes
on any particular piece of gear and get just as many different prices!

>>>>But, they will all be in the ballpark. I know. I checked. The Antron was within 10 dollars at the three amatuer stores that I checked.

It was about 50 percent less (give or take) at the CB shops (both local and internet).

Guess you are wrong again... Seemingly, I think that you will forget this comment, and all the rest of the proof that I have made for you when you go to write the next chapter of your bullshit story guised under this thread, though.

Likewise, I can find a Cobra 148 at truck stops for the same 175% difference in price vs dealers like Copper that the Antron "for instance" reveals. I have seen them for as much as $250, when the truth is they can be
had for far less!

>>>>>Ahh..... But, now you are not comparing apples to apples, you are comparing tangerines to tangelos.

A truckstop is not a mailorder discount storefront. A truckstop is a truckstop.

Why don't you look at the price of a Grant XL at AES and then at Copper (since they are both mail order (more or less) and cater to two completely different license classes) and then report back to the rest of us.

Wait.. That would be disastrous for your end of the stick. You would be proven (yet again) wrong.

So what about THAT price fixing, Toll?

>>>>yadda, yadda, yadda.

>Put up, or shut up. The thread, as well as you, have wasted entirely too much
bandwith!<

So, confronted with the challenge of providing a bonafide reference to the

ALLEGED price fixing, ie: a catolog reference, etc, and UNABLE to face up to the challenge, you, like the little boy on the school yard who is getting beat
at basketball, wants to take his ball and go home?!?!

>>>Nope, seems like I did a fine job. I have included posts that will hyperlink you to the exact pages, so you can concur for yourself, as well as put the prices in the post. Should make it a little easier on ya.

I DID put up, Toll....I don't need to reiterate for you or anyone else that which is archived here.

>>>>No, I believe that you do.... Because obviously you have missed the point entirely.. And now choose to chase a ghost of something that only you are looking at!

NOW...

UPON WHICH PUBLICALLY ACCESSIBLE RESOURCE ARE YOU AND WINDY ONE MAKING THE
ALLEGATION THAT AMATEUR RADIO EQUIPMENT IS PRICED UNREASONABLY?

>>>>Please see the posts above.

It's a simple question, so I imagine simple minds should be able to answer
it!

>>>EXACTLY... Which only makes me ask one question??? Why haven't you gotten it yet? The rest of us have...

Guess simple minds can't get it then, can they?

Got **YOUR** dancing shoes on, Toll?

>>>>Tap, Jazz, Ballet and modern. What style do you prefer?

Toll Free
Dancin' the night away!

What you've failed to understand is that the common operator knows
to hum, speak, or whistle a steady tone into the input of his SSB
transceiver when he's looking for a peak wattage number. When the
ALC is disabled, the output waveform under those conditions will
appear to be a constant carrier (at a constant amplitute that's
easily measured). Under those conditions, an average-reading
meter will show a peak figure since the waveform looks like an
AM carrier.

If you don't believe me, secretly go to my website and read the
reasons why all wattmeters are wrong. From there you can justify
any argument.

Bill,

You can actually do the proof and find out the the PEP/(2.828*1.414) = RMS,
and PEP/2.828=AVG.

Since the PEP/2.828=AVG, and the RMS value of an AVG component is 1.414, it
actually comes out to PEP/3.998792.

The Bird meter is an averaging type wattmeter. A calorimeter type meter
would give you the RMS value.

Hope this helps to get the others to understand.

Toll Free

The other thing you can do is inject a carrier of equal strength as the maximum PEP value that the radio is capable of, and that will give you the saturated PEP output of the amplifer.

Since the carrier PEP is the same as the AVG, the two numbers are identical.

This makes it even easier. Crank a 20 watt carrier into your linear, and you know how much it will PEP on sideband!

Very true, Hey Tim put your bird meter on an amp on am and get a reading
then switch over to SSB and get a reading, with a amp say a 5 pill you will
see a substantial increase in what wattage, but if you use bird with the pep
kit installed you will not see that big of a difference, the ssb reading
will hardly change from what you read on the averaging bird meter. Tim needs
a thruline with the PEP kit.

I would have to agree.I bought one about 1 1/2 years ago. Worked fine and was "ok" on accuracy till I bumped it with about 3 kw. It started acting funny. With about 5kw it burned up the line section.They are only using pvc for the insulater. If they really want the meter to handle a "true" 5-10kw they will need to redesign the line section using teflon and go with LC or type N connectors and not 239's.I can say that they gave me a refund and did send me another one to try but the same thing happend with the second unit. Just remember....there are no watts like "Bird" watts.....and your BigBamBoo is gone......

I love this stuff too. Roger, roger, Roger. It has got to have something to do with the mentality of some no code techs and where they are coming from. Locally here, we have a fairly active RACES group due to freqeuent severe weather problems. One basic rule is that you do not go out of your way to draw attention to yourself such as flashing lights and such. One of these guys, a less than professional looking outside salesman, bought a well used Suburban, had it repainted in bright colors SIMILAR to a police cruiser, and had EMERGENCY COMMUNICATIONS painted on the side, all looking quite professional. The light bar on the top was just too much though, and when he was caught running those lights during a storm event, he was drummed out very quickly. He loved to show up at activities wearing cammo BDU's.

Think very long and hard before you would ever consider buying a BULLDOG watt meter!! In the event you have purchased one recently have it checked for accuracy! The 2 meters I was subjected to were the biggest pieces of garbage I/we have ever seen!

I purchased one and it was so out of calibration it was ridiculous. I sent it back to the pathetic sob in Tennessee who manufactures the Bulldog. Thinking, well maybe I just got a bad one.

Of course he thinks he is the only one that knows anything about Watt meters and was very difficult to deal with. He sent a replacement after waiting 3 weeks. The replacement had a damaged meter movement and was as poorly calibrated as the original meter. His SWR meter funtion was as poorly calibrated as the rest of the meter

What a waste of time dealing with a arrogant, pathetic sob!

>Subject: Re: Local Radio Operator Questioned by Police
>From: "Wildcat" wildcat@tp.net
>Date: Wed, 15 September 1999 08:36 PM EDT

>OK, please post Diamonds CB antenna Line for us. You cant because they dont have one. Diamond, like many other manufacturers does not want to cater to CBers because they know CBers wont pay but Hams will. <

You keep changing the variables of the post, Windcat.

First you assert that the manufacturers are locked into price gouging because the "Hams" will pay top dollar for their gear. I pointed out that every major manufacturer has more than one outlet for it's products, none of which are "exclusive" to Amatuer markets.

Then you switch to Amateur vs CB. Apples and Oranges as always, but still I proved you wrong again.

Now you have it down to ONE manufacturer of Antennas that won't sell an 11 meter antenna, allegedly because they think they can gouge Hams for the "Big Bucks" (my emphasis, not yours)

>The same goes with Cushcraft, Hygain, and just about every other Ham oriented manufacturer that once had CB lines, of which all of them abandoned their CB products because of the justification of cost. If you're only 30 or less you wont remember.<

Here you go again. You started out arguing about the price of items like Henry and Alpha amps, now you try to make your point over antennas.

As for the arguments on amps, you can make the arguement that Alpha amps are, quite honestly, real big time bucks...and you'd be right. I've not priced an Alpha, but an acquatinence tells me I could easily drop $6000 or more into one.

But I can easily spend less than half of that on an Ameritron amp that will put out the legal limit and only the most discerning ear on the Ham bands would know the difference

Cushcraft and Hy-Gain STILL manufacture antennas capable of operation on 11 meters...the only difference is that you are going to have to search them out. And many of the antennas they DO make are sold under different lables. Of course they have a hard time competing with Asian import mobile and even some base antennas that sell for pennies on the dollar over their US counterparts...BUT you get what you pay for.

The brands you quote are built to MIL-SPEC standards in many cases, and are priced accordingly. You want quality...break out the gold card...you want

cheap and quick, roll your pennies.

As far as the Comet and Diamond antenna lines, many of their Amateur antennas are built to very exacting specifications and even go as far as gold plated contacts. Do you think Joe-Average CBer wants to pay for that kind of quality in an antenna when all he REALLY wants to do is ratchetjaw around town or get occasional "Smokey Reports" while on the road?

>Yeah, right Steve, whatever you say. Are you going through Fred for your Vanity call?<

You think that paragraph was DEFENDING Maia?!?!

You ARE sick! The FCC may have sucked me in with the price drop after the first round of Vanity calls was issued, but I did fill out my own applications.

>This sentence doesnt make any sense, in English anyway. My god do you communicate in your QSO's in such a dyslexic fashion?<

If you think so, Cat. The problem is that if YOU had a hard time reading it, YOU are the dyslexic, not me. I would be willing to lend you my Handbook of Neurological Nursing. (Guess what I do for MY bucks, Windy?)

> That FACT and the POINT still remain valid, HAMs will pay more money for equipment and Ham suppliers know it. Maybe you
can explain to me how in an perfectly competitive elastic market a 2 Meter antenna that is identical to an 11 meter antenna (except for its length) should sell for 500% more money. Please post this explaination Steve (without the dyslexia).<

OK Wildcat...what would you like to compare? Moonrakers vs HyGain tribanders? The A99 vs the Hustler 5BTV? And what shall we use for a resource, Windcat? Copper? AES? HRO?

Since YOU quote the figure of "500%" increase in price difference, YOU quote me and this NewsGroup which antennas to which you refer.

Let me give you a couple "for instances" where you are going to look REAL DUMB, though:

Radio Shack 2 Meter Mag-mount mobile antenna: $39.99
Radio Shack "Deluxe Mag Mount CB Antenna" $38.99

Oooooh...ONE WHOLE DOLLAR! Let me get an equity loan for THAT!

Radio Shack 2M/70cm Thru-glass antenna $39.99
Radio Shack 11 Meter thru glass antenna $39.99

Zingggged again, Cat...."0" difference!

So WHERE is your "500%" price difference, Cat?

As for the "perfectly competitive elastic market", I guess you haven't been to too many Hamfests...I see hundreds of people walking around haggling price, even over the smallest components. Hardly the "willingness" to pay high

dollar, Cat.

The present 144/440MHz antenna on my car cost me a wopping $15.00. And that was NOT a "sale" price. It was bought cash-money from a retail dealer.

I could go on and on, and quote from a dozen different catologs, but since YOU are asserting the supposed "500%" inflation, YOU provide the references on where you are getting you information from.

Is that plain enough for you, or would you like it in Braille?

Steve

>Date: Wed, 15 September 1999 11:55 PM EDT

>Back before the government do-gooders banned the sale of metal CB antennas, Cushcraft marketed a "Ringo" CB antenna. It was a vertical half-wave, 3.75db gain, and sold for around $35. The SAME EXACT antenna was marketed to hams as a 10-meter vertical and sold for $55-60!<

Since WHEN are "metal" CB antennas banned, Enforcer? And I think you would be hard pressed to find that same price disparity today.

Certainly, you can ALWAYS find someone who will try to sell you something for more than someone else will, but then it's YOUR money and YOUR responsibility to shop for the best bargain.

>In fact, the same thing occurs today with the Solarcon A-99. Copper sells it as a CB antenna for $39.99. AES sells it as a 10m antenna for $64.99. Which would you choose?<

Good point, and exactly what I said. You pays your money, you takes your choice. That's why all these dealers have tollfree (no pun intended!) phones.

Steve

>I can see a ham radio dealer lauging somewhere. :) <kaching $$$>

When one considers that CB accessories outsell Amateur accessories 10 to 1
easily, I would say that the prices of the Amateur gear are quite reasonable.

OR...the CB prices are grossly inflated since they (the dealers) can sell
10 more of the CB antennas than the Amatuer antennas at the same price...

So WHO is gouging WHO, Boys?

> Since WHEN are "metal" CB antennas banned, Enforcer?

I believe the CPSC banned their sale and manufacture in the early 80s. 1983 or 1984. Anyone know for sure?

At the time, my local Radio Shack had a supply of their "Archer 5/8 wave base antennas" on hand. They clearanced them for $6.95 each. I bought all 12 and sold them individually for a handsome profit! Reason for the low clearance price was because they had to get rid of them before the CPSC do-gooder law went into effect.

For some strange reason, though, beam antennas were exempt from the ban. Anyone know why?

Note: this address does not accept unsolicited e-mail. Please contain all discussion regarding USENET posts to the appropriate newsgroup thread.

>New England area and all of the GI Joe Wanna Be's are out in full force. Here's what some of these guys are saying and doing:<

SNIP!

I guess it's useless to waste bandwidth to point out that most Amateur stations involved in public service communications must usually pass traffic in a manner the served agency finds understandable.

I won't argue the fact that "plain English" would be just as easy, but since you took the time to make the swipe, I thought I'd burst your bubble a bit.

>They are actually using words like "that's affirmative" instead using of the word "yes".<

As opposed to "Tenn-rogaah dee" on CB?

>Saying 0700 instead of 7 o'clock.<

Actually, in moast of the world outside the US, the 24 hour clock is the standard, not the option.

>Calling their club meeting house the "Command Center".<

Actually, if you read most FEMA or Red Cross disaster manuals or deployment plans, that's what THEY call it, and it's their show.

>Instead of saying "Can we send a couple to guys over to the Hospital for a pickup?", they're saying "Can we mobilize several units to MED 1 for a transport".<

Supported agency communications. Quoted out of context by someone with an axe to grind, I would say.

>Most of these guys are feeling the need to report every 5 minutes in what direction the clouds are moving and what color the sky is. So far this morning I've heard that the sky in the same location, at the same time was 7 different shades of gray.<

Did I miss something, or isn't that what SKYWARN was created for...?!?!

>Two guys were actually arguing about which one of them was actually the "Incident Command Team Leader"<

A regretful place to do it, but the ICT is a valid FEMA designation.

>And finally, one Ham is leaving his home for his club headquarters 12 hours
before the storm might hit because he's afraid the storm might hit and he'll be
trapped with his wife with no utilities for 5 days. ;-)<

What's the beef? I wouldn't want to be stuck with no utilities and your
wife for five days either.

As long as they are wrong the same everytime you can still use them to check for changes and make adjustments to your equipment or to compare one item to another.Since almost every brand of meter shows different readings anyway this is all we can hope for...Its only when they show something different everytime you use them that they become worthless

I hope I did`nt brain my damage.

> 2510 going into oscillation upon transmit.

To fix the oscillation completely change r 159 to a 100 ohm. This resistor is next to the 2166 driver
what this will do is increase the negative feed back to the driver there will be no power loss and will not change any tuning. This fixed mine and two others completely. I would leave the caps on the finals..

First off 1.4:1 is not a high reading,in fact it is a very low
reading.
bandwidth with a vertacal is a result of the elements length to
diameter ratio,build a whip out of 1/2" copper pipe!
different cars present different ground plane characteristics.

3029. how to use sideband on 11 meters

Newsgroup: rec.radio.cb
Date: 1999-09-16 00:00:00 UTC
From: twoir082@aol.common
Message-ID: <19990916140936.13018.00001050@ng-fs1.aol.com>
Source record: 3073

1. Listen before calling

2. Make short calls with breaks to listen

3. The usual procedure of a QSO is to give a signal repoirt and tell your name and location. Make reports honestly. Give data conciesely in first transmission.

4. Check transmitter adjustment. Avoid splatter. Keep modulation constant. Don't ride the microphone gain. Keep the gain down and do not whistle into the microphone.

5. REMEMBER : The QSL is considered as the final courtesy of a contact and is an amateur radio tradition. If you want a QSL from your contact, send him/her a card. And as a matter of common courtesy, send a card ov everyone who sends you one.

6. Never break into a conversation. Always wait until both operators have finished, even if it takes one hour, and even if it means you loose the contact. It is ok to announce that you are on the side (once only).

7. If you hear someone calling for a particular country or particular station, unless it is your county do not answer. Please wait one minute to determine if the station calling has made contact with the station or country he has called for. If you do no hear a contact made, then try your call for him.

8. Send QSL cards only with the permission of the station contacted!

9. Don't repeat on the radio the QSL address that appears on the directory

10. Say the callsign once, after that repeat only the unit namber without the full callsign.

11. Don't write unit number or callsign on the envelope.

12. Don't use the 555 for QSO because it is an internation call frequency !

There are a lot of most wanted countries in the world. In many of these countries, most of them are islands, don't live any 11m DXers or they are QRV sporadicly only.

Some of these countries were activated by some enthusiastic DXers, who visit such a country only to give the rest of the world a chance to make a QSO. Other DXers take their radio on holidays to every country and activate a holiday station.

Usually a DX'peditions is temporary and has a special callsign (e.g. "ï¿½" - first activation, or "DX" for the 2nd, 3rd activation)

Usually they give as QSL information a callsign or the whole address of the QSL Manager every few minutes between their contacts. QSL Managers are used because the QSLs will be mailed from another country.

DX'peditions stations are interested to work as many stations as possible and on the other hand nearly every DXer want to work the most wanted countries. To handle so many stations, they give out a progressive number for every QSO.

You can believe that the costs for mail and the special QSL cards are extremely high, besides the cost for the journey is high enough. That is the reason why you have to add $1 US or 2 IRCs as contribution for your reply card.

The same applies also for stations in most wanted countries. They demand for a small donatation to reply their cards to you. Imagine they certainly have thousands of QSLs from Europe and America, so they are not really interested in your card, but you want to receive his/hers. So help these operators with the mailcosts for that they keep active and keep QSLing.

If you want to work an interesting station or expedition, you need a different behaviour than for a normal QSO.

1. As soon as you know that the DXpedition is activated, look for it (internet clusters) at the usual time to copy that zone or continent

2. Listen carefully in the frequency before you make the call

3. Before you contact a DX'pedition, listen carefully for the callsign and the QSL information and try to find out the address of his manager instead of constantly asking. If you ever had the chance to do an activation you know how annoying it is to get asked every few minutes for your callsign or your address.

4. Make short calls with your callsign only (or even only unit number). DX'peditions are done by experienced operators that know which country belongs to which prefix. If you get being called by the team, confirm your callsign and the received progressive number. Add maybe signal report and your name (depends on the pileup).

5. Never give your address to a DX'pedition, you only produce QRM.

6. Some expeditions are a working with lists, that means they listen carefully and write down the callsigns. If they acknowledge your callsign, you shouldn't call anymore. If not and the list is complete, wait until they start another list.

7. Be a gentleman and standby if someone else is talking to the team. If you do not disturb the exchange of the details, the expedition can continue more quickly with the calling stations. Please remember that some expeditions have blacklists of operators with bad behaviours who will not get a progressive number!

8. Send your QSL as soon as possible including progressive number (!) and your return address. Do not forget the required contribution and add a Self-Addressed-Envelope (SAE). This will increase the returning time.

Yes, it definitely works in some situations, and it does boost modulation a bit, which is helpful since I only get about 70-80% max with the 45HH (didn't find a modulation mod for this on the web). Don't expect to hear weak signals all of a sudden that you weren't able to hear before w/o ST on. In my experience, it's only useful for clearing up those you can already hear quite well...

Thanks for sharing about this. Perhaps if he can't sell his product he will figure out that it needs to work properly and he needs to provide proper service. Have no idea what you paid for this but you probably get what you pay for. Even if it is consistently incorrect, it is no replacement for an accurate meter and if he advertised it as being reasonably accurate, that is what he should deliver. Would love to see his advertising for this--"Consistently Inaccurate!"

Quite honestly, This is the first person to complain about Carl's product.

I have used one, and although they are rated to 10Kw, I wouldn't use one past 5Kw. Prime Minister has said the same thing, on this newsgroup. I tried one, and after about 6.5 to 7 grand, it got screwy and finally failed.

Other than that, they have proven to be a good meter in everyday use. Maybe the quality has suffered lately, but you honestly have the first complaint I have heard about them!

If you have never used one then why the comment?
I used one for years and found it to be a good little amp.
I heard this; someone I know; etc.. doesn't quite answer the man's question, now does it?

Jeff
ThUg LiFe wrote in message <24652-37DFE50A-39@newsd-243.iap.bryant.webtv.net>...
David,
The old sayig goes "You get what you pay for" that is ever so true
with the radio. Me personally have never ran the 225, but from what I
hear from MANY people they are junk.#1 they are MASS produced, that for
one shows that the quality would be less desireable. Now a question for
you. Why would you want to run an amp on AM? #1 You will be breaking the
law, #2 your neighbors will more then lkely hate you for the RFI. Now
I'm not gonna' nit pic here at that cuz I have used an amp a time or 2
so I'm no hipacrit (how ever you spell it) In my opinion David...try for
a Texas Star or a DaveMade. You mght pay a lil more..but I can assure
you that you won't have too much problems with it. (as long as it's
hooked up right of coure) Good Luck

One of the problems SKYWARN net controls have is getting people to shut
up and just report what is necessary. Reminds me of the SKYWARN net that
was up and the net control ask for stations to report "minimum reporting
criteria only". He repeated this several times to emphasize he wanted
only "minimum reporting criteria". If you don't have that, shut up. Next
thing heard...
station..."kxxxx"
net control..."kxxxx go ahead"
station..."we're out here on Sketter road just north of Petticoat
Junction and looks like lightning may have struck a tree out in the
middle of this pasture.....no damage, kxxxx out."

net control....."Sheeesh"

Some guys just can't stand it unless they can make sure they are heard on the net, the fact they have nothing worth reporting dosen't stand in their way.

Excuse me oh dyslexic one, I mentioned manufacturers as an example. I can name about a dozen more if you like.

> Here you go again. You started out arguing about the price of items like
> Henry and Alpha amps, now you try to make your point over antennas.
]
Look Steve, both myself and the rest of the group are still waiting for your explaination of why a Ham antenna is 500% more than a CB antenna. Amps, antennas or accessories, its all the same. Its been two postings since I asked this of you and all you've done is retort with some redundant babble. If you're going to post a response, please use some intellegence will ya.

I love to debate people however I wont engage with someone who's shooting blanks. You must be a real popular guy on 20 meters.

From: Jack Thurston <fire228@cybertrails.com>
Message-ID: <37E15F94.1605@cybertrails.com>
Source record: 3093

FYI,........

An am signal consists of a carrier
and a pair of sidebands, upper and lower....

An ssb signal consists of a single
sideband with the carrier and the remaining
sideband suppressed or removed....(filtered)

The instantaneous power levels involved
with any mode of operation which uses one
or more sideband components can only be ACCURATELY
measured with a power meter that is able
to respond fast enough to "follow" the power
levels contained in the sidebands, as these
levels are of relatively short duration,
corresponding directly to the use of
consonant and vowel sounds in human speech!
RMS, Average or "Heating Power" readings
are fine for checking unmodulated am carrier
levels or fm transmitters. In both modes,
both am and ssb, especially on ssb, voice
peaks sometimes rise as much as 2 - 3 times
above "baseline" audio levels. (varies with
individual voice characteristics) What we
are failing to understand here is that these
peak levels occur in literally fractions of
seconds, making accurate readings with equipment
designed to measure RMS or average power
absolutely impossible! EQUIPMENT OF THIS TYPE
DOES NOT RESPOND QUICKLY ENOUGH TO "READ"
POWER LEVELS OCCURRING IN THESE SHORT PERIODS
OF TIME, which correlate directly to variations
and patterns of individual human speech!
.....

Only every post made....Including this one.

>Excuse me oh dyslexic one, I mentioned manufacturers as an example. I can name about a dozen more if you like.<

You continue to make accusations that are obviously a fallicy to everyone else here. Your credibility is about zilch point squat.

I disproved your assertion with verifyable facts.

You respond with personal attacks...very professional. I am sure your Mom is proud of you.

>Look Steve, both myself and the rest of the group are still waiting for your explaination of why a Ham antenna is 500% more than a CB antenna.<

No....I already provided references that shoot holes in your "500%" claim, Windy. And the exchange between you and Toll even further proved me right. Not even close to the "500%" you assert.

If you use the reference to the A99 (about $40 per your quote) and it's "amateur" price of about $70, that's STILL not "500%". That's only 175%...not even close to your assertion. And NOT an unreasonable difference between retail dealers.

Until you provide a verifyable public source (a catalog, paper or on-line is certainly suitable), you are exaggerating at least, and lying at worst.

>Its been two postings since I asked this of you and all you've done is retort with some redundant babble.<

Uhhh....YEAH....Right.....

I have provided VERY specific reference to prove you wrong. You simply keep bantying around this alleged "500%". YOU have yet to prove your assertion.

>I love to debate people however I wont engage with someone who's shooting blanks. You must be a real popular guy on 20 meters.<

FACTS, Windcat, FACTS.....WHERE is this "500%"?? Your imagination does
NOT count.

>If you're going to post a response, please use some intellegence will ya.<

The only question of any intelligence deficit on my part is expecting that
you will produce any of the references that have been asked of you.

No....I already provided references that shoot holes in your "500%" claim, Windy. And the exchange between you and Toll even further proved me right. Not
even close to the "500%" you assert.

If you use the reference to the A99 (about $40 per your quote) and it's
"amateur" price of about $70, that's STILL not "500%". That's only 175%...not
even close to your assertion. And NOT an unreasonable difference between retail dealers.

Funny.... You completely dance around the subject at hand, but seem to think that the rest of the newsgroup is fixated around the 500% claim.

While I also feel that the claim is rediculous, I also find your statement copied above just as ludicrous.. About the Antron. 40 dollars at a CB store, 79 dollars at a ham store.

100 percent price difference is an OK difference just because of different dealers?

I guess you would pay $40,000.00 for a car just because when the rest of us are enjoying the same car for $20,000.00?

This is a real issue, and as far as I know, the ENTIRE issue? While Wildcat did make a rediculous claim of 500%, you have continued to skirt the issue that he brought up with it, and the price fixing that happens among the amateur Vs CB market.

Put up, or shut up. The thread, as well as you, have wasted entirely too much bandwith!

modify to what?
at 1/4 or 1/2 watt you'd be lucky to do any better on 3 AAA cells.
as for channels, look at the crystal and see which harmonic it operates on.
3rd, 5th, 7th etc.
decide which channels you want.
if they are within the tuning range of the radio, figure out what the
difference is and figure out the crystal freq will be.
example, if you want to jump 10 khz, and the crystal is a 3rd harmonic, add
.333 to the crystal in it to get the new frequencys.
when you order the new crystal, be sure to take the new freq out to the last
decimal place as the old one.
if the old one is XX.XXXX, take the new one out to 5 decimal places or your new
freqs will be off by a multiple of the error of the new crystal. i know of no
pll mods though.
by the way, how about some more of those world famous jokes??? :):):)
jeff
P.S.
i don't want to hear any shit from hams on this because a ham with his numbers
posted on the rec.radio.amateur ng asked almost the same question 2 weeks ago
only he wanted to modify his HIGHER POWERED AMATEUR EQUIPMENT for frs freqs. so
keep it to your self.
jeff

I am not worried about the damn batteries! All I am wanting to know is if there is a way to modify these radios so they can perform better than stock!!!! Better range, cleaner audio, or whatever.
By the responses, you think I was asking a technical brain surgery question!!!! If you know how to modify this radio to perform more wattage, power, cleaner audio, anything, please respond.. If you don't know anything simply find something else to read and don't respond with some bullshit garbage answer that doesn't answer MY QUESTION!!!.

>battery that my dad gave me, and a length of speaker wire which I fashioned
>into a crude dipole. Hey, it worked! Not bad for a 12-year-old with no
>money.

There you go!! sounds like me with a shortwave Reciever. I have the Radio
Shack SW-100 reciever and fashioned a longwire out of real cheap Speaker wire
and for a plug used a plug from a cheap set of head-phones!
If anyone does try that, Make sure there analog ones as Ive tried a digital
headset pug and it wouldnt work.

Just because the sevice has "amateur" in the name dosen't necessarily
mean the operations are or should be amateur in operation. A lot of the
emergency communications on the amateur bands are handled very
professionally.

Just curious why a Swiss vessel in the Atlantic would choose 27.585
(from among all other HF and VHF distress frequencies)?

I'm sure the radio officer of the vessel wasn't looking for a freebander
to help him.

More likely that 27.585 is a legitimate Govmt comm frequency in the
St. Pete/Clearwater or Bahamas area. This fact sort of blows the freebander
excuse that "no one uses those freqs."

Just run into a Galaxy Dx44V that the larger copper coil in the back had a cold solder, barely touched it and it popped up... was making a lot of noise, etc... this took care of most of it... just thought I would say something just in case someone was having some noise problems, and probably would be a good thing to check.

>Message-id: <NhdE3.5524$C3.34020@insync>

>Funny.... You completely dance around the subject at hand, but seem to think that the rest of the newsgroup is fixated around the 500% claim.<

(1) There is NO dancing around ANYTHING, Toll. Windy asserts a 500% inflation in the price of communications accessories sold to hams vs CBers, and I say he's full of it. And I proved it.

(2) I have no idea what the "rest of the newsgroup" is fixated on, nor do I care. If they wish to participate, they may do so. If they don't, relief is just a mouseclick away. So far though, it's just you, Windy and I.

>100 percent price difference is an OK difference just because of different dealers?<

And I guess you have never paid $1.00 for a small Coke at a concession stand in an amusement park or $2.50 for a draft beer at "the game"? Come on!...The market will bear what the consumer is willing to pay! And if someone is willing to part with $500 to $1000 without shopping around for the best deal, well, the old addage about a fool and his money being parted is true.

>This is a real issue, and as far as I know, the ENTIRE issue? While Wildcat did make a rediculous claim of 500%, you have continued to skirt the issue that he brought up with it, and the price fixing that happens among the amateur Vs CB market.<

Toll, are you on drugs?

Price fixing?!?! HAH!

I can pick up any CQ or QST and spend an hour on the phone getting quotes on any particular piece of gear and get just as many different prices!

Likewise, I can find a Cobra 148 at truck stops for the same 175% difference in price vs dealers like Copper that the Antron "for instance" reveals. I have seen them for as much as $250, when the truth is they can be had for far less!

So what about THAT price fixing, Toll?

>Put up, or shut up. The thread, as well as you, have wasted entirely too much bandwith!<

So, confronted with the challenge of providing a bonafide reference to the ALLEGED price fixing, ie: a catolog reference, etc, and UNABLE to face up to the challenge, you, like the little boy on the school yard who is getting beat at basketball, wants to take his ball and go home?!?!

I DID put up, Toll....I don't need to reiterate for you or anyone else that which is archived here.

NOW...

UPON WHICH PUBLICALLY ACCESSIBLE RESOURCE ARE YOU AND WINDY ONE MAKING THE ALLEGATION THAT AMATEUR RADIO EQUIPMENT IS PRICED UNREASONABLY?

It's a simple question, so I imagine simple minds should be able to answer it!

Got **YOUR** dancing shoes on, Toll?

>From: "Wildcat" wildcat@tp.net
>Date: Thu, 16 September 1999 09:19 PM EDT

>Gees Steve, It sounds like your a legend in your own mind<

If you say so, Windy.

>An Antron 99 is $40 - A Diamond 5/10 is $190, which is a 470% price gain for an identical antenna (except for the frequency) THIS IS WHAT I ORIGINALLY POSTED, If you go back and actually read the posts, you may become enlightened.<

The Antron 99 is not the same antenna, therefore the analogy between the two is irrelevant. And like anyother manufactured item, you can go Brand name or you can go generic.

>A Wilson 1000 magnet mount mobile is $59 - A Larson 2 meter/ 440 maget mount is $132, which is a 200% price gain for an identical antenna (except for the frequency)<

And as I stated before, there are just as many OTHER antennas out there that can be had for nearly pairity prices, Windy.

My Ford Contour is around $12.5K the way it's equipped. A similar sized Caddy is around $35K to $40K....geez, Windy, both have a steering wheel, stereo, air and four tires...isn't that gouging?

>How old are you anyway? My god cant you do basic mathematics, or at the very least, look at catalogs to compare prices.<

My mathematics skills are just fine, and how old I am is nunya.....As far as comparing prices, there's the rub, isn't it now?

I have the AES and HRO catalogs at hand, and I can access most anyothe resource on-line, as can you. And like you, I am sure I could find numerous cases of any two SIMILAR items, and in some cases the SAME item for drastically different prices. But I can also find them for less, too, which really deflates your numbers in a hurry.

>>I disproved your assertion with verifyable facts.
>
>Verifiable with who? Only you.<

Ummmm, anyone of over 3000 Radio Shack stores nation wide, thier web site, or the catalog from which I quoted the prices earlier.

>Wow Steve, is that the best you can do?<

I COULD call you for what you are, but why go there? This was sufficient.

>Steve Im glad to see you've got a new screen name however the new skill you should be aquiring is learning how to read because you obviously mastered that skill yet.<

Oooh...very skillful sidestepping, Windy One. But to which new screen name do you refer, save the one where I had my nursing credential included, but which STILL had this callsign in it. No cover-up here, Mr. Artful Dodger.

I can read fine. You can't accept that you have been bested by someone with a catalog and a few minutes of research.

Steve

No. Even with cheap "leaky" coax, the majority of the power is
confined between the center conductor and inside of the shield on the
cable. It would be more of a problem if your cat were sleeping near
the antenna than on the coax.

Besides, CB has miniscule power output, far less than
the ANSI RF safety regulation limits for RF exposure near
30 Mhz (225 watts, I think), so even if your coax is "leaky"
(poor shielding), he would be safe.

If you're really worried, you can borrow a field strength meter, and
connect the coax to a dummy load, and run the FSM along the coax.
Chances are, you won't see much RF off the coax unless you're
running considerable power.

At ham power levels, you need to worry about this sort of thing.
For CB, not even worth considering.

Why do some hams or people claming to be hams come on CB RADIO & re.radio.cb for? I guess they are either lost or causing trouble. If HAM is so good then why not each person stick to their frequencies! I once got some posts & E-MAIL (On some BBS'S @ a time they had local BBS'S) that I was in the wrong to come on their BBS saying that hams are cussing on CB RADIO & making problems. Remember HAM as people say have good people who do good & all this stuff. If you all do not want us CBers on the rec.radio.ham side or on ham radio messing you all up then stay off of all areas. We have as much right as you to use or talk about CB RADIO! Thamks

TollFree said:
<<And even more likely, you are completely unaware of what you are talking about (as usual), posting something that you think you can get away with nobody calling you on that makes yourself look better!>>

OK well, "call" away.

27.585 is currently listed as a military frequency in Scan Fan publications (available at all the better truck stops).

27.585 is currently not assigned to amateur or citizens band users.

So there are only three possible conclusions we can draw:

1. This info is a (widely published) typographic error that no one has chosen to correct.

2. The FCC is lying and 27.585 is legal for anyone to transmit on.

3. 27.585 is a military frequency.

While some might desperately want to believe #1 and #2, I think the only sane conclusion is #3. Therefore, casual use of 27.585 by freebanders is an unlawful (as well as irresponsible) act.

I have to believe that the Swiss vessel chose that frequency to issue its distress call not because it wished to contact a "freebander"...but because it is a bonafide military channel.

Yes, it IS fortunate that the incident with the Swiss vessel came to a happy conclusion and that the freebander was able to contact the Coast Guard. But it might just as well have been a very tragic situation if a couple of outbanders using the frequency inadvertently prevented a Military radio operator from hearing the Swiss vessels distress calls.

I saw that mod as well as the caps as I was looking, but as I
understood it the negative feedback modification did lower your output
(I'll soon be using this radio with a texas star 500v so I'd like to
keep the higher output). Plus de-soldering one leg of each cap was
simply quicker to do as a first try. Sometime soon, hopefully this
weekend, I'll resolder the capacitors, swap the resistor, and see how
it works.
Out of curiosity, do you (or does anyone) know the original value of
the resistor for, id purposes? I'm just being cautious, as I don't
have schematics I'd hate to find out I replaced the wrong resistor.

Thanks,
dirk

Greetings to all.

A New IRC channel has opened on DALnet IRC, so if you want to join in in a group conversation online - then pop to the http://www.mirc.co.uk/ website to download the latest version of the client software - get connected onto the DALnet servers and join the #ukpg channel.

There are no set topics, and the chat sessions are quite reliable and fast compared to the chat interface on the UKPG website ;-)

It is mostly active in the evening (GMT) - all are welcome for a friendly online chat - mind you it may not be busy the minute you get there, but i hope that a few will remain in the channel so that new visitors don't think its an
empty channel with just me sitting in there!

I look forward to seeing some familiar "nicknames" there.
I'm also looking out for some sensible people to opt as channel opearators to help manage the channel.

Cheers & Regards!

Greg

I was wondering, if someone were to put a rather large linear amplifier in a car would it be ok to mount the amp in the trunk? Is it ok to have say 10ft of coax between the radio and the amp? Coax is defined as high quality, not cheap kind. Like other kinds of audio equipment the longer the line into the amps the more suseptible the system is to noise, and if that noise is present then the amp will of course amplify the noise as well. Will having a short line to the antenna cause problems? Using different lengths between the amp and the speakers will have different effects on an audio system, but no problems other than harshness in extreme cases. Sorry if I'm asking questions that sound goofy, but I've just been wondering alot lately.

a: "Whatever floats your boat". (THE KEY TO HAPPINESS)

and:

B: "When in Rome, do as the Romans do". (OPTIONAL)

Personally I'm not into codes or jargon of any kind. At the same time, if usuing them makes you happy.....go for it. Life is too short to worry about such trivialities or conforming to the irrelevant rigid expectations of others. So in the spirit of open mindedness I close with the following:

"Heres waving a hand at ya!.....Keep the shiney side up and the dirty side down....catch you on the flip-flop.....we're gone, bye bye!" And I'm off the key. :-)

HELLO!!!! Just because you get a Ham license does'nt mean you are excluded from using CB....Sheeesh! I use 11m as well because I like talking to and meeting new people regardless of what band they operate on. As a matter of fact, I've assisted several CBers in getting their tickets in the capacity of both instuctor, and volunteer examiner.

> I once got some posts &
> E-MAIL (On some BBS'S @ a time they had local BBS'S) that I was in
the wrong
> to come on their BBS saying that hams are cussing on CB RADIO & making
> problems.

It must therefore follow that all Hams are rude unfriendly people right? Following this flawed logic, if you have some unfortunate circumstance with say....a person who collects stamps, your conclusion would be that all stamp collectors are flawed in the same manner....right? Did you consider that maybe your post was taken as being accusatory in nature and prompted the response you got?

> Remember HAM as people say have good people who do good & all this
> stuff. If you all do not want us CBers on the rec.radio.ham side

As far as I'm concerned you are welcome to post on Ham newsgroups all you want.....just don't get mad if you get the cold shoulder after saying something derogatory about Hams.

> or on ham
> radio messing you all up then stay off of all areas.

Sorry....We have just as much right to transmit on 11m as any other citizen. Transmitting on Ham bands however is a priviledge that must be earned, otherwise you'd breaking the law. Get your ticket and we'll welcome you to the Ham bands with open arms.

This response to your post is not intended to flame, or castigate you in any way, nor should it be taken as such. Rather, it intended solely to point out a mistake in logic, and perhaps modify your conclusions about Hams in general. And why not go for your ticket? You won't regret it, I promise.

Ouch! Either way you go it's going to cost you. I concur with the other posters....Peter Dahl is the way to go (if cost is no object). I believe they're still rewinding old transormers as well. Just send them yours with all voltage/tap information and they'll fix you right up. Best bet however, is to hope to find a junker that still has a good transformer and canabalize it. Otherwise, unless you really like that amp, I would reccomend against putting too much money into it (you'll never be able to re-coup it if you decide to sell).

If the amp is an 8 pill, it won't saturate when driven by a
plain radio.

> Since the carrier PEP is the same as the AVG, the two numbers are identical.

That I can go along with.

> This makes it even easier. Crank a 20 watt carrier into your linear, and

Crank a steady tone into your radio that produces a 35 watt
carrier-like output waveform in order to know what the PEP
output is under those conditions.

How come everyone out on the band today has to run power? I myself use to but to me all it does is just increase the noise level out there along with all the other crap you here. Most people don't even know what there doing and they over drive the sh^t out of there amps which really helps. I would say that 99% of the people they are talking to are with a couple of miles of them. Does a person really need 500 watts just to tell some guy f^ck you buddy or go f^ck yourself? True power does give you distance but most of the time people that are hearing you ten miles away can't get back to you. (Can't we all just use stock power)

This has been talked into the ground before but just to review, since CB is an entirely different service with different rules and objectives, essentially anyone is allowed to use the service without regard to any technical skill that they might or might not have. Heck, even your aunt, Emma, could get on CB if she wanted to, and she is 97 years old and doesn't understand yet how that light starts to glow in the ceiling when she pushes the button on the wall.This means that even some amateurs might use CB to communicate with some people, and yes, they are entitled to use this news group just as much as you are. Some chutzpa to think that they shouldn't be here because they also use another radio service. Same argument would apply if you said that anyone who drinks beer should stick to the rec.beerdrinkers.anonymous news group and stay away from rec.radio.cb. I know this won't clear it up in your mind because it apparently isn't receptive, but it my best effort this morning. Now hopefully you can drop the issue and get back to radio.

your cat will be fine. but next time try this: take two or three wraps around the middle of the cat with the coax... next, scratch the cat's back until he puts his tail straight up... this should give you a couple extra dB on transmit depending upon the length of the cat's tail (may require trimming).

It's a real shame, Windy, that you have to act like this. THIS is the
very same stereotype that people perceive as being "a CBer".

I don't mind telling anyone that despite almost 3 decades as a licensed
Amateur that I am still on CB. But people question being on the air with "all
that profanity and childishness".

I tell them it's just a vocal minority.

Sometimes, I wonder.

I guess another reason is because some HAM OPERATORS are upset that the FCC took it away from them. Also what about these goverement frequinces? I mean this is a no no frequincy for anyone except goveremet people. So if this is true then why not do the same for CB RADIO? I mean HAMS do not want CBer's on theire frequiencies talking CB RADIO I do not think, so why come down on 11 meter band to mess it up. I know NOT ALL HAM & CB OPERATORS are bad, it is only a few who mess it up for the rest of us.

Right, just like some CBer's who go to 10 meters who mess hams up.

Your right. I am wondering if I am letting some of these no good people get
to me & talking it the wrong way. I thank you! Your ringht there is nothing
baring hams or anyone from doing what ever. I am sorry!

Yes, but why do people from ham or say they are come on CB & messed it up,
or was it non hams who messed it up by cussing.

You idiot.

Cussing didn't "mess up" cb radio. A multitude of things "messed it up"...
And their are people out their who say it isn't messed up at all.. I tend
to agree that their is something wrong, but no matter what town I go to, I
can always find a clean conversation (although maybe a lot of arguing) on
channel 6, and if I just want to talk to someone, I find a good SSB
operator.

CB radio is what you make of it, Pee Wee... However, I gather that you are
unable to make anything of anything in life due to your Pee Wee sized brain!

The people who messed up CB radio where the ones that where overpowered,
foul-mouthed slack-jawed, slope-browed, inbred, cornfed, and uneducated!

Look in the mirror, 10-4 good buddy.

This is Toll Free, and I'm 10-10, Listenin' in!

You could get a ham hf rig that's modified for 11m (illegal but works), but if you are going to be spending your time on ch.19 AM, a good cb will work better (most of the newer ham rigs suck when it comes to AM transmit audio and noise-blanking). The Grant-XL and PC76 were good suggestions and for the little extra money, you'll probably like the Grant so you can do some yakking on SSB. Good luck!
Woody

How can I tell how much amperage I would need to run a small linear - 200 watts on low occasionally, with a VC 100 also hooked upt to it? The VC takes just 1 mAmp or less.

I will be going to CB@one list were it is legal (100%) & it is not full of cussing or has & trash like it is here. I tried this one & for the most parts some people have cussed @ me & said things that said I was metal. I just do not like seeing a good hobby going bad. You all say ham is good & it may be & some parts may be 100 worse. I wish you all would smell the coffee & grow up! On one list it is legal so if you want to join me then 10-27 your self to the good legal side of CB RADIO & go to http://www.onelist.com & become 10-8 on there. There it is no cussing & family like it was.

Please read all of this post.

1. I have a WORKING Realistic TRC-458 which is a 40 channel CB base AM/SSB radio that I am selling for a freind. The radio is some scratches and a bit dirty, (belonged to a smoker). Has NEVER had any extra channels put in it.
Great radio, as it can do over 200 channels. Info on the net. It has the 858 chip.
Full service manual included (a $ 25.00 value)

2. A TRC-449 mobile CB radio (same board as the TRC-458) for parts.

3. A Radar Detector, manufactured in the 70s (working the last timre I used it before the law changed).

4. A Kenwood KSC-4 battery charger (working) with service manual.

I am asking $ 125.00 + shipping for ALL . Items sold as-is, radios have no mikes.

Please reply to email as I do not often get to this newsgroup. He want to get this stuff sold ASAP, so please reply ASAP. I will reply to you Monday to Friday only.

Thank-you,
Greg

What is this immense hang-up you seem to have about cussing. I remember you as Pee Wee on one of the internet CB Message boards and everyone got tired of your tirades on there and you eventually left.

As the Eagles said in their last album, GET OVER IT. If you don't like the cussing or other ways people operate their radios, change the channel or turn it off.

And since you are going to the CB list at onelist, I suppose you will be going 10-7,,,,AGAIN!!!!!! Sheesh.

Boy, I agree that if he only gets 30 watts he has a lemon or a bad meter. It has been many moons since I installed my 225 but I remember that I was getting over 150 watts on high - it may even have been 170 watts. Maybe he has the switch on low power and that would make him in the right range.

Moondance.

I have a Grant XL and a Galaxy 225, which I have been told is the same amp as the PAL. I have had zero problems and have been told that the system is very strong and clear. It works very well on SSB too except for the delay. You get used to it though. I got mine from Exports R Us and was happy with the service. Say hello to Steve.

Moondance

The other thing you can do is look for a Maverick (their is one on E-Bay with new tubes for less than 200 bux), PDX-400 or any other 4 tube or more D & A amplifier.

If worst comes to worst, I might have a transformer here that would power the entire unit with just one.

Let me know... The one I have I won't let go cheap, either.

3140. Re: What is Narow FM, Wide FM, Narow AM? What is diference form usual AM and FM?

Newsgroup: rec.radio.cb
Date: 1999-09-17 00:00:00 UTC
From: Michael Champion <champion.michael@attws.com>
Message-ID: <7ru19g$7ar$1@redftp.redftp.attws.com>
Source record: 3140
Cross-posted to: alt.radio.scanner,alt.radio.scanner.uk,rec.radio.scanner,aus.radio.scanner,phl.scanner,rec.radio.cb

The broadcast band for your home stereo FM is Wide-FM - Public service radios are narrow FM and Aircraft use AM as well as the CB band - They are just different types of modulation. Wide means a wider bandwidth so your music sounds good on the FM Broadcast Band - public service radios dont need high quality and it takes up less room in the radio spectrum - AM is used on aircraft becasue it can be heard at greater distances than FM - FM is a close range mode and AM is more for med-long range.

FM is created by slightly changing the frequency with the persons voice audio.
AM is created by changing the power output to the persons voice audio.

Toll Free,

So let me see if i have this right....
You want me to subject a pair of
mrf455's to 30 watts of carrier.........

"The other thing you can do is inject
a carrier of equal strength as the
maximum PEP value that the radio is
capable of, and that will give you the
saturated PEP output of the amplifer".

(The 148gtl that I use will produce
30 watts pep)

With 6.75 watts into a pair of 455's
I am already seeing 110-120 watts out..
At 8 watts in we are seeing 180 watts out!

Which is really interesting....the 2 455's
under test are (each) marked 88 watts with 4 watts
input from the people at rf parts....guess
my dosy can't be too far off!

All I can see is that if I follow your
advice, what I will be left with is 2
pieces of ceramic "toast" with some silicon
jelly in the middle of both!

I can already say with a great degree of
certainty what the outcome of this hypothetical
test will be if carried to your suggested
conclusion! No Thanks.....................

Jack

does someone need 500 watts to talk to someone near?
granted, there is an abuse of power on cb and the out-bands.
this is why i advocate a no-code license in a segment of the out-bands for our experimental use with a 200 or 300 watt limit and better enforcement of rules and limits associated with it should it ever happen.

Jack,

No, you don't have to subject your amplifier to 30 watts of carrier.

Inject a single tone on SSB.

Look at it on a scope.

What do you have.

A carrier!

And if you are doing it for just 5 or 10 seconds (for the sake of testing),
then you hurt nothing.

I have driven a quad of 455s with 100 watts PEP, and it did nothing to hurt
them.

Thats 25 watts a piece!

So, I don't think that you really have much to worry about.

CB. 27 Mhz and 2 mtr is 144 Mhz.. too broad of a jump. better off
running 2 separate amps. One would be very illegal since CB you are not
allowed to run Amplifiers at all.

Put a digiscan on it.

That, or you run an EPROM board with another PLL.

Either way, you are out some money, and a lot of time.

Better to sell it, and pick up an easier modified radio, unless it is EXTREMELY important to you.

Toll Free

KAT77 <kat77@SoftCom.Net> wrote in message news:37E32FD3.38369882@SoftCom.Net...
I am looking to modify this chip, Sanyo LC7185-8750, it is located in the Cobra 18, and the HH33. I have the spec. sheet, but I can't figure out a way to modify it. If anyone has a clue, please let me know. It may be possible for me to send one of these spec. sheets your way.
I know if I change it's frequency of 10.24, it will drift a little.

Thanks,
BlackCat

Well, in order for your vehicle's computer to have a problem at Y2K,
it would have to have some reason to look at the current date. Since
you can disconnect your cars computer from power indefinately and then
connect it back up, it will work just the same. If it needed a date,
then there would have to be some sort of battery on board or some way
of letting the user set the date upon power up. I don't think there
is any such thing in ECM's.

Figuring worst case of 50% efficiency and a 13.8VDC supply you would need approximately 30 amps.

Worst case you would need approximately 400W (200 / .5) of power consumption so:

From Ohm's law
P = I * E or I = P / E

28.98A = 400W / 13.8VDC

Good luck.

Well, you said new but not resistive spark plugs and wires? You need the resistive type. Second, the coax isn't picking up the interfierence, it is the antenna! Your car is radiating to the antenna. I assume you are using a magnetic mount? Those don't have a real ground but use capacitive coupling for the ground plane.That can sometimes be the source of the problem also. Try running a ground wire of 10AWG wire from the base of the antenna to the chassis of the car, probably the roof rack. Keep the wire as short as possible and use soldered-on lugs. Make sure the ground circuit is as clean as possible. What I mean is as close to copper to copper as possible, you don't need a ground loop!

If this don't fix it, buy a new car :-)

who would want an amp for cb AND 2 meters?
might you be a ham? if not, watch out for leland, rfenforcer and the other hams.
they will jump down your throat.
if you are a ham, you're ok because they will find some excuse for you.
just so that you know, sometime in the past 2 years, i read, in either qst or cq magizine, a construction article for a broadband, dual FET, no-tune amp that would cover from below cb, past 2 meters.
i can't remember which mag. or which issue but if you could get into the archives, you probably find it.
good luck.

sorry for the double posting.
i'm not sure if i agree with you or not as you seem to attack both cb'ers and hams.
if this is the case, i have to respect you for being balanced anyway.
it is true that there is a lot of fighting here between cb'ers and hams here but if the hams would take their eliteist, holier than thou attitude and check it at the door when they get here and stop playing RF police about subjects that don't concern them, everybody would probably get along a lot better.
things concerning cb'ers on ham bands and bleedover to ham bands are VERY relevent to their hobby and should be addressed but out-band activities and power on cb and out-bands are NOT their concern. the problem is, that they take it upon themselves to condemn people for their activites.
if they came here with a more appealing demenor and try to guide instead of a lot of smart-ass put downs, they would have a lot wider audence.
the way they act, if they were asshole salesmen, i wouldn't buy one if i needed one.
have a good day.
jeff

according to my cb pll data book, there no channel mods for this chip. it has a direct VCO so you can't even use a crystal kit.
you can't change the 10.240 crystal because it also controls the 10 khz channel spacing.
i've had sucess in either changing out the 10.240 xtal with a 10.245 or pulling the 10.240 with a capacitor to get even number channels between the cb channels ,ie; 26.960, 26.970 etc.without and unacceptable amount od drift for AM but thats about all.
good luck.
jeff

i can't speak for the quality or performance you'll get but radio shack, at least used to, sell an ignition noise filter that you install between the ign. wire and spark plug. you'll need as many as you have spark plugs. check with chevy first to see if it will mess up anything in the vans computer as it will be a resistance in the circuit.
before computers in cars, it didn't matter but now, it might.
another thing that i would look at is the quality of the coax.
you can get cheap coax with a 75% braid or the "top-of-the-line" belden brand with 92%.
the difference is how tight the outer shield braid is woven and how much wire is in the braid and the price.
good luck.
jeff

Source record: 3174

You said you had new plug wires, but you didn't say if they were carbon core or copper core. Even some new carbon core wires demonstrate high resistance and could be noisey, so check them with your ohm meter. New wires should have resistance approaching zero.

this is exactly the holier-than-thou BULLSHIT i'm refering to. if a ham comes to this ng, he USUALLY comes with both barrels loaded to blast someone for doing something on freqs that don't concern the ham.
if toll free is talking on ham freqs illegally, bitch him out. if not, butt out.
i still want to see your badge sheriff or see you leave town.
why don't you apply for commisioner of the fcc? then, and only then, will it be your personal business what OUT-BAND freqs or what power level toll free or anyone else, for that matter, uses.
if we get caught, you will get a free ticket to laugh your ass off but until you start paying our fines, again, butt out!!! if you and the other eliteists, brother-bubba-better-than you hams would change your attitudes and try to guide instead of comming on like a go-to-hell televangelists, you might get someone to listen to you. until then, all you sound like is a bunch of door-to-door salesmen selling stuff that nobody needs and bad attitudes with free demonstrations. after reading all the uppity crap, i would, and have, avoided a ham ticket like the plague so i wouldn't have to communicate / associate with people who act like this. the company is definitly better on the out-bands.
i like to go to the hamfest around my qth because of parts availability and prices and i get some of the best OUT-BAND equipment around and even if i don't mention that i am a cb'er or outbander, (OOOOOOH), to people that i don't buy from, i still encounter the same SHIT ATTITUDES.
aparently you all went to the same sales school and passed the test with flying colors.
the way you and other like-minded hams act here isn't exactly the way to sell anyone that your views are the "correct ones. if you were asshole salesmen, i wouldn't buy one from you guys if i needed one now.
there was a time that i considered getting a ticket and joining the local ARC

but i couldn't stand the attitude of these and other hams that i've LISTENED to on dx ham bands. i and no one else is / am better than anyone else but those hams with this attitude problem either haven't learned it or have forgotten it. have a good day.

I purchased a Cobra 148 gtl st and am very happy with the "functionality" of the unit. (It's a little big tho and if the size is not a problem, I would suggest the night hawk series.) I had a previous thread in this newsgroup asking the fine people which antenna I should get. You may want to read up on the responses. This is where your range will be affected. I purchased a Wilson 5000 mag mount through JCRE and have yet to really test the range due to the high levels of noise and skip during the day... but it gets out well I'm told.

Hope this helps.

After owning both a Pro-520XL and PC-76XL there is a world of
difference. The PC-76 has the added advantage of the built in SWR
meter to catch antenna problems before they start. PC-66 and PC-76 ar
ruggedly built with metal chasis and the 500 hundrd series is well
just a basic cb. If you want a better radio that will last a long
time get the 76 or 66.

Actually was built on it, Uniden owned the patent rights to the
circuit board, and cobra couldn't take it with them when the quit
having uniden build them. That is why uniden built cobras are in such
demand. And Cobra's are junk now.

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=167245050
I believe if you are looking for a nice Mark III SSB you now have a chance to own it. It is all tested/aligned a ready for you. There's no reserve and it starts at $200.00
It is worth your hard earned money and time.
Thank you for reading and atleast enjoy the pictures of my well taken care of CB Relic. The serial# on Transmitter and Receiver match and it has the original banana mic that has sold on Ebay for $70.00 and up alone.Check out the pictures of this clean radio, both inside and out.
Mike

Remember the scene from Casablanca where Capt. Renault says to Rick:
"I am shocked, SHOCKED to discover that gambling is going on here!"
Then the casino manager reminds him to take his winnings with him.

I am shocked to find out that illegal radios and amplifiers are being
sold here on the newsgroup and at nearly every CB shop and truckstop in
the nation! Not to mention modified ham rigs.

theres dif methnds used to locate abusers.
One way is if the persons name and address are given, then the FCC can go right to the door, but if I'm right must have a search warrent to enter. That is after being sent a notice they have to reply to and give steps to avoid that problem again.
One other way is Via rf hunt down, in that theres dif methods. Hams do foxhunts (radio direction finding) or also another is triangulation. That method involves at least 3 units in which area is marked off on a map, then using Feild Strength measuring quipment they can pinpoint the location of the operator.
This is just a couple ways, there may be more.
I hope this helps answer your ?.

3214. *Look At this!!!! Radio Interferance with Aircraft

Newsgroup: rec.radio.cb
Date: 1999-09-19 00:00:00 UTC
From: Scentless Apprentice <senorpurpl@hotmail.com>
Message-ID: <7s3t8h$6pd$1@winter.news.rcn.net>
Source record: 3214

Found this on alt.radio.pirate. Kinda scary when you think about it:

The following was monitored on 14313khz & 3950khz
and was a rebroadcast of information from the
WD4LUQ repeater system. WD4LUQ, Bill Houston,
is a FCC employee assigned to the FCC's Powder
Springs, GA office.
Houston operates a ham radio station from his
FCC office during business hours.

The FCC tracked down a ham radio operator,
N2BYE, Kevin M. Kelly, who was allegedly interfering
with in flight aircraft. (See FCC Press Release,
dated Nov 13, 1998.)

Houston said Kelly was caught when he made the
mistake of not imitating a drifting spur and started
transmitting on fixed channels. Apparently, he
should have continued imitating a drifting spur to
evade FCC detection.

Kelly was using a cable TV modulator and an
amplifier as transmitting equipment. His antennas
were hidden in his attic, and he had video surveillance
equipment to detect any approaching FCC vehicles,
according to Houston.

Houston indicated that Kelly was mentally disturbed
and was guilty of what was in the FCC press release.
Houston further indicated he would provide additional
details of the case on the telephone.

The WD4LUQ repeater system operates on these
output freqs: 146.895mhz, 224.880mhz, and
444.700mhz.

I DID state that...

I was testing the export version of the Command Technologies HF2500DX... A three tube amplifier.

It would run up to 8 Kw on the lower end of the spectrum... Markedly less on 10 and 12 meters, although it would loaf along at full legal limit.

3228. Radio Shack Rebirth? TRC-495/HTX-10

Newsgroup: rec.radio.cb
Date: 1999-09-19 00:00:00 UTC
From: aardvark <aardvarkiq@JnUaNcK.net>
Message-ID: <37E5A9D6.6A3490B4@JnUaNcK.net>
Source record: 3228

First things first a Radio Sack radio is not a RCI 2950, how ever if i had to get one, the TRC-495 (The one with upper & lower side band w/ freq. counter) looked like a nice little radio till they discontinued it. However I've noticed in the new Radio Sack 2000 catalog they now have the HTX-10 which is a 10 meter rig, that does AM, FM, USB, LSB and I believe CW. The two look identical. Are they? Also are they the same radio that was offered in the Coppers catalog as the EAGLE (tomahawk?) or something to that effect? Lastly (and most importantly) are there any freq. mods for the TRC-495 or the HTX-10 or the EAGLE.

Thanks in advance,
john (AARDVARK)

I have thought about becoming an ham operator, because I am getting sick of 11 meter because they bitch and argue to much. And all of the ham bands are used. The communicate voice, computer, and morse code. I have no problem with them having all there bands.

> anyone can operate a ham radio therefore there should NOT be anything to bar us

> I will be running a Ranger 2950 with a 2 watt deadkey and swinging as high
> as she will go.

Sell your 225, put the money you get with the $200 you now
have, and save up until you can get a Texas Star 500. The
Texas Star 500 is a really good match to the 2950. It's
also a big enough jump in output that you'll notice the
difference. In other words, going from a 225 to a 350 is
not very satisfying in that it really doesn't make that
much difference. However, in my experience as a CB amp
dealer, going from a 225 to a 500 will more often than not
satify the customer to the point where he's not looking to
upgrade again right away. Another thing you should know
is that the 500 (four 2SC2879 transistors) is the biggest
amp that can be efficiently run using the stock charging
system in most vehicles. That's an important part of the
decision for many people. That's the level that satisfies
most of my customers. In other words, many people will
stop at the level where they know they're running as big
an amp as their electrical system can tolerate. It's a
big step mentally and financially to decide that you're
into CB enough to put together a second, devoted electrical
system just so you can run a bigger CB amp. The vast
majority won't go that far--they're satisfied knowing
they're doing the best they can without taking that next
big step.

> thanks for your Info.

You're welcome. I hope this helps.

The best would probably be the Uniden Grant XL or Cobra 148GTL.Top of the line in any reputable brand would be OK.Make sure what you buy has SSB for maximum range,other than that range will depend more on your antenna.
Stay away from the rigs that call themselves "10 meter" radios but are really just pretenders,these usually have idiotic stuff like transvestite boards and echo.

Exactly what I stated.

>
>Modifying one that DID not have 11 meters from the factory would make that
>same radio illegal IF USED on 11 meters, and put you in a bad spot if the
>FCC ever came to inspect your station.

Also what I stated, illegal IF USED on 11 meters, Not illegal to own.
Thanks for reinforcing what I have already stated.

>
>This has nothing to do with a CB radio. Look at Part 95 from the days that
>the Heathkit you are talking about was made.... They didn't include some of
>the clauses of today.

>
>11 meters was also a ham band when that radio was made.
>
>So, your point is nothing.... My Kenwood TS-440SAT will do 11 meters. I
>bought it that way.

You seem to have trouble understanding that part 95 makes your TS-440
illegal to use on 11meters, but not to own. Part 95 does NOT make it
illegal to own a trransmitter that is capable of exceeding the power
limit or running outside the 40 channels. It does make it illegal to
use it. So my point is more than nothing.

>
>Does that mean that it is illegal? No. Do I have a MARS / CAP license?
>No.

Why are you wasting your time restating what I already did?

>
>Do you honestly think that if the FCC came to inspect my station for
>(suspected) 11 meter bleedover, and all they found was my Heathkit SB-220
>and TS440 in line that I would be able to say "I never used it"? Even if I
>had a bone stock Cobra 29 on the shelf?

Do you have an amateur license? If you do You wouldn't be in trouble
with the SB-220. If you don't have a license, its illegal to posess
the SB-220. Thats clearly spelled out in part 95, also what I have
posted several times. Get that mina bird to read posts for you, then
you won't waste your time reposting what I have already stated.

>
>That is a bullshit argument that you are proposing.

>
>And you are wrong.

Since you have restated what I did, that makes your statements wrong
also.

Source record: 3262

They were not banned. They were discontinued by most manufacturers for CB (residential) use because of the legal liability resulting from electrocution accidents. It was like giving some nitwits a lightning rod during a thunder storm. The manufacturers decided to drop these antennas because of liability reasons, not legalities. These manufacturers continued making them for commercial applications because they know most commercial guys know what they're doing.

> Hmm, what about metal TV antennas? To short to be a problem? What
> about metal antenna mast?

TV antennas aren't swaying in the breeze 18 feet over someone's head, add to that a 10' or 20' mast. I've seen guys, while installing an antenna, walking around their house holding onto a 10' mast with a 21' Super Penetrator on top knocking into all kinds of branches, wires and other stuff. It is extremely dangerous. I'm sure someone sued which resulted in a legal president, of which most all manufacturers took notice. Ill look it up in West's Law Review when I get the chance.

The following was taken from the FCC's web page at
http://www.fcc.gov/wtb/prs/citzn.html

Please look below, and you will see where the FCC CLEARLY states that having a CB radio unit that is modified in any way voids it's acceptable use on the 11 meter CB band.

This should put an end to that debate.

May I raise the power output of my CB unit?

Absolutely not! That would be unfair to the other users sharing the channel by raising the level of radio noise. You must not attach a "linear," "linear amplifier" or any other type of power amplifier to your CB unit (CB Rule 11). Moreover, you must not modify your CB unit internally. Doing so cancels its type acceptance and you forfeit your authorization to use it (CB Rule 10).

It clearly states that modifying your CB radio voids its type acceptance, and makes it illegal to use.

Doesn't say (as some suggested) that if you just don't use it on 11 meters for transmit it is still legal, but it does state that if it is modified, it is illegal for use.

Plain english.

I have copied the entire page below... Plain english rules for those interested.

Toll Free

CITIZENS BAND RADIO

What is CB?

CB is one of the Citizens Band Radio Services. It is a two-way voice communication service for use in your personal and business activities. Expect a communication range of one to five miles.

Do I need an FCC license for my CB unit?

License documents are neither needed or issued. CB Rule 3 provides your authority to operate a CB unit in places where the FCC regulates radiocommunications, as long as you use only an unmodified FCC type-accepted CB unit (CB Rule 9). An FCC type-accepted unit has an identifying label placed on it by the manufacturer. There is no age or citizenship requirement.

Where may I operate my CB unit?

You may operate your CB unit within the territorial limits of the fifty United States, the District of Columbia, and the Caribbean and Pacific Insular areas ("U.S."). You may also operate your CB on or over any other area of the world, except within the territorial limits of areas where radio-communications are regulated by another agency of the U.S. or within the territorial limits of any foreign government. You may also be permitted to use your CB unit in Canada subject to the rules of the Canadian Department of Communications.

May I raise the power output of my CB unit?

Absolutely not! That would be unfair to the other users sharing the channel by raising the level of radio noise. You must not attach a "linear," "linear amplifier" or any other type of power amplifier to your CB unit (CB Rule 11). Moreover, you must not modify your CB unit internally. Doing so cancels its type acceptance and you forfeit your authorization to use it (CB Rule 10).

How high may I put my CB antenna?

There are no height restrictions for antennas mounted on vehicles or for hand-held units (CB Rule 8). For structures, the highest point of your antenna must not be more than 20 feet above the highest point of the building or tree on which it is mounted, or 60 feet above the ground. There are lower height limits if your antenna structure is located within two miles of an airport.

Which CB channels may I use?

You may use any of the 40 CB channels on a "take-turns" basis. These channels must be shared by all CB users. No CB channel is assigned to any specific individual or organization (CB Rule 7). Be cooperative. Keep your communications short. Never talk with another station for more than 5 minutes continuously. Then wait at least one minute before starting another communication (CB Rule 16). Use Channel 9 only for emergency communications or for traveler assistance.

What are "ten-codes"?

Ten-codes are operating aids used by public safety and other professional communicators. The FCC does not regulate the meaning of the ten-codes. CB Rule 12 authorizes CB operators to use ten-codes.

Where do I obtain my CB "handle?"

You may use on-the-air a pseudonym ("handle") of your choosing.

Are there other private Personal Radio Services for short distance two-way voice communications?

Yes. There is another Citizens Band Radio Service, the Family Radio Service ("FRS"). You are authorized by FRS Rule 1 to operate an FCC-certified FRS unit in accordance with the rules. No license is issued. Expect a

communication range of less than one mile. See Part 95, Subpart B of the Commission's Rules, 47 C.F.R. 95.191-95.194. There is also the General Mobile Radio Service ("GMRS"). For operation in the GMRS, however, your system needs a license. GMRS systems are used to facilitate the activities of the licensees and their family members. Expect a communication range of five to twenty-five miles. See Part 95, Subpart A of the Commission's Rules, 47 C.F.R. 95.1-95.181.

Where can I get a copy of the FCC Rules for CB?

The rules are published annually in the Code of Federal Regulations, Title 47, Telecommunication, Part 80 to End. They are written in plain language to make them easy to read and understand. Order from the U.S. Government Printing Office, Superintendent of Documents, Mail Stop SSOP, Washington, DC 20402-9328. A copy of the operating rules (95.401-95.428), current at the time of packing, must be furnished by the manufacturer with each CB set sold. For technical information, see 95.601-95.669.

For complete information, see the Commission's Rules for the Citizens Band (CB) Radio Service, 47 C.F.R. 95.401-95.428.

If you have any comments or questions about these services, you may call Bill Cross at 202/418-0680 or send E-Mail to bcross@fcc.gov

Lost in Space WAS BETTER than "star trek." I think that the reason star trek was pumped is because: (a) NO CB's on the program, like Lost in Space had (hand held WT's!), and that their shows were Christian based (where the bad guys always lose), not like star trek's "humanistic" religion programs promoting the one world nonsence! Ask yourself: WHO was control in each program? A UN slave state "earth" or the USA ? Or was "control" really on "Get Smart" against KAOS ? Do we have KAOS on the CB band today? Where is the LIS Robot saying "WARNING-WARNING"---Texas star overheating BIG pills on your dilithium crystal tetrachloride crystal coatings! Did the Robinsons get back in '97 ? Did you know that John Robinson was a fameous figure in our history (Pilgrims)? Getting back to '99 now, in a future post I may blast a left coast CB dist. for selling off freq. crystals. I am going to see IF they will give me credit for ones 2 keelocycles high on xmit they sold me before I tell you good CB shops out there to AVOID THEM because of selling OFF FREQ CB SINthasized crystals to me. I should of just ordered them from hurricane land instead.
Dave!!!

Actually, if you get a 2 meter amp, it IS a CB amp! Because 2 meters IS the Hambo's CB 2 meter band! I'm not on there, it's what I hear from the Hambo's that I know. So your 2 meter amp IS a 2 meter CB amp!!!! Dave!!!!

If your going to put an aend to the debate post the part 95 plain
english version which reads:

RULE 9 - Equipment

{A} You must use an FCC type accepted CB transmitter at your CB
station.You can identify an FCC
type accepted transmitter by the 'type acceptance' label placed on it
by the manufacturer. You may
examine a list of type-accepted equipment at any FCC Field Office or
at FCC Headquarters. Use of a
transmitter which is not FCC type-accepted voids your authority to
operate the station.

>>>>>> here it says use a transmitter, and that use of a transmitter which
>>>>>>is not FCC type accepted voids your authority to operate the station.
>>>>> What does use of a transmitter mean? It doesn't mean own or
>>>>> or poses it clearly states USE.

{B} You must not make, or have made, any internal modifications to a
type-accepted CB transmitter.
<*read Rule 25> Any internal modification to a type-accepted CB
transmitter cancels the
type-acceptance, and use of such a transmitter voids your authority to
operate the station.

>>>>>Here again it says USE of, it never says own or poses.
>>>>>You lose the authority to operate the station when you use the
>>>>>transmitter

Ooohhh.....

Your a bad man...

Afraid to use his own email address or post from his own server, I see...

Guess your wife would be real happy and proud of your spineless ass,
wouldn't she...

Kids wear bags on their heads when you make them ride around in the brown
Pinto with an orange door?

Yep... Guess you got me.

Guess Josephine will be parading my name and call sign around the world now.

Guess I am a marked man...

Guess.... Guess... Guess what.

I don't care.

This happens about once every four or five months.

I think it is funny that some asshole already tried to change my bio at QRZ,
though. That was cute!

since the mod is cut one wire and plug something in and its a full band radio
and the fact that the radios come out the box tuned for 11 meters rather than
10(if you can get one tuned from the factory) i would say they are pretty much
cbs. how many other ham radios do you see with echos and reverb?

BS.

The 949 and 959 are built in the same factory and distributed by the same
people who do the DX series radios.

They are a stripped down, legal 11 meter radio.

Once again, you are wrong.

3279. Fried Radio

Newsgroup: rec.radio.cb
Date: 1999-09-19 00:00:00 UTC
From: RLB <the_tomcat@yahoo.com>
Message-ID: <01bf02cd$b8e48b00$1a0f44d8@default>
Source record: 3293

I was fumbling around in the dark with a 20 year old General Electric and got my positive and negative leads mixed up. Stupid move I've never made before and will never make again. Needless to say, I made a little smoke and killed my radio. Now, I was wondering if anyone can tell me if there is a simple fix, like a burned out unit or wire on the board, or if the radio is blown all the way through.

Nothing at all works. No lights or sound. I noticed a burned out segment of wire on the bottom of the circuit bored, the flat side with all the soder. I tried to soder it back together, but it started sparking once I hooked the power up. I took a meter and touched almost every bit of soder on the board. Each one yielded 12 volts with the exception of soder along the melted line. I could get 12 volts in the hot places no matter if the radio was switched on or off.

Obviously, I'm not the best at working with things like this. I'm really just wondering if I could fix it without too much trouble or if I should chuck it into the trash. As I said, it's twenty years old, I found it in a discarded location and I've got three other radios as it is. So if I wind up tossing it, I haven't lossed much anyway.

Thanks for reading.

Most 10-meter radios I see for sale have roger beeps built in. So,
either the manufacturers of 10-meter radios make much more money on
selling to CBers, or there are a lot of hams who use roger beeps on 10
meters.

For a base unit, you might consider a Uniden Washington. These radios have a very clear modulation. Base station radios have a built in power supply that allows them to be plugged directly into an electrical outlet and do not require a separate power supply like a mobile radio does. They also have more of the " look " of a home appliance that helps them fit into the overall asthetic of your home furnishings.

However, a mobile radio can be adapted for use as a base station by using the previously mentioned power supply, and has the added benifit of being designed for use in a vehicle, in effect giving you two radio's in one. A really good mobile radio is the Uniden Grant XL.

Take one of these radios, hook it up through some good coax, like RG 213 U, to a decent antenna for the money, like a Maco 5/8's wave ground plane, and you will be on your way. So Long

Here is the excerpt from Part 95:

Rule 9 - Equipment

{A} You must use an FCC type accepted CB transmitter at your CB station. You
can identify an FCC type accepted
transmitter by the 'type acceptance' label placed on it by the
manufacturer.
You may examine a list of type-accepted equipment
at any FCC Field Office or at FCC Headquarters. Use of a transmitter which
is not FCC type-accepted voids your authority to
operate the station.
{B} You must not make, or have made, any internal modifications to a
type-accepted CB transmitter. <*read Rule 25> Any
internal modification to a type-accepted CB transmitter cancels the
type-acceptance, and use of such a transmitter voids your
authority to operate the station.

Sorry Tim, they don't come out
of the box from the MANUFACTURER
working on 11 meters!
The only way they operate on 11
meters "out of the box" is if your
local distributor or retail outlet
has previously performed the
modifications.
These radios come into the country
as 10 meter radios! If they didn't,
we would never see any of them, much
less be able to buy them!

My point exactly. You NEVER hear roger beeps used on the 10-meter ham band (except by illegal bootleggers.) The inclusion of such a feature makes it pretty obvious these are intended to be used primarily by CBers, not licensed hams.

Recently, I have also seen "10 meter radios" factory-equipped with "robot voices" and other "noise toys." Not a real popular option among amateurs.

>The Galaxy 949 and 959 are 11-meter only radios from the factory!!

Correct. Most of the Galaxy radios are 10
meter rigs. However, the 949 and 959 are true 11 meter CB rigs with legal limit
output.

I am kinda new to CB ....
Question: There are obviously thousands of these 10-meter Galaxy rigs operating
on
11 meters. How does one get them modified for 11 meters????? Is this
something anyone with a screwdriver and
wire cutters can do by themselves, or are
we talking brain surgery here?

Maybe Roger Beeps?

{B} You may use your CB station to transmit a TONE SIGNAL only when the signal is used to make contact, or to continue communications (Examples: tone operated squelch, selective calling circuits). If the signal is an audible tone, it must last no longer than 15 seconds at one time. If the signal is a subaudible tone, it
may be transmitted continuously only as long as you are talking.

The original purpose for the roger beep in the early NASA moonshots was to let both the astronauts and ground control know when the other party had completed their transmission as well as providing an indication that the mic was no longer open, indicating to the receiving party that that they had the "all clear" to begin the next transmission!

In the above sense, one could read the section in part 95 above and conclude the following!

The use of the roger beep could be considered to be "an invaluable aid to the continuation of communications" when perceived in the manner in which it has been used in times past, as in the case of NASA, etc. .

Ahh, but the beauty of the Uniden Washington is that it was also designed to be used as a mobile. It comes complete with DC power cable and mounting brackets/hardware to install it in a mobile. Albeit, you'd probably need a vehicle with a huge dashboard. It would probably work best in a camper or RV. It is nice to know that you can hook it up to a car battery in an emergency situation.

Your wrong Jack,they don't even cover the entire band,don't have all the legal modes commonly found in real HF rigs,no memories,no scan,no CTCSS,no split TX.They are EASILY made to operate on 11 m and are desighned to be that way,they also include LSB which is not used on 10M. These are non type accepted CBs thinly disguised as 10 meter radios.

Why would a ham spend that kind of money for a low powered radio that
only has 1 band? For $599 you can get an all mode HF with 10 bands
including 10M plus 100 watts,memories,scan,etc.,etc.
And there are a lot of used rigs like my $325 TS-430S that make the
Galaxies look like the cheap toys they are.

3325. Uniden Pro-series?

Date: 1999-09-19 00:00:00 UTC
From: Keyton Guthery <keyton@mindspring.com>
Message-ID: <7s3lfi$204$1@nntp6.atl.mindspring.net>
Source record: 3339

I am looking for a CB for basic comm for frequent road trips. Uniden's webpage has several reconditioned units at (what appear to be) pretty decent prices. How do the PRO-series units stack up against their bigger brothers like the 66 or 76?
Remeber that basic communications is all I'm looking for (monitoring upcoming weather/road/police conditions, communicating with others travelling in tandem with me, passing the time on the road, etc....) and the smaller footprint of the Pro-series seems attractive.
OTOH: does something like the PC66XL offer a significant difference in quality and features for the small price difference?

thanks,

Keyton

Actually, the article was published in Popular Communications, not Popular Electronics. I believe the article appeared in the September 1999 issue of Pop'Comm.

Not necasarily (pardon typo), I had a Cobra20+ that had the leads accidently crossed and burnt the radio right up!! This one also had the 3rd wire for chanel memory and when I looked at the board, the wax or what was used to cover the finals was all melted down!! The radio was also tottaly dead so its was converted into spare parts after that.

OK you HOLIER-THAN-THOU hams out there, i emphisize "holier-than-thou as this
DOES NOT apply to hams who DON'T act like the RF police.
i don't think we need to hear anymore on the subject of OUT-BAND or ILLEGAL
RADIO EQUIPMENT and cb'ers here.
we don't interfere with such important communications as aircraft and most
police and fire freqs are way out of our range.
there's a lot of dirt on both sides of the street so clean up your side with
all of the hams who do mars and cap mods without a permit and those who
INTERFERE WITH AIR COMMS before you point to the dust on our side with the
reletivly few problems that we cause with consumer electronics and YOUR ulcers
worrying about a band that even YOU can't legally talk on.
you've got all that spectrum going un-used and complain like the owners when we
venture into the de-milatarized zone.
grab a broom, a shovel and a mirror BEFORE you condemn us the next time.

You've got it wrong. Hams don't want guys like
that in their ranks. You won't find any hams
defending this guy's right to do what he did.

If hams had a newsgroup that discussed methods
of interfering with aircraft comms and traded
tech tips and gear designed to facilitate that
activity, then you'd have more of a point.

>One way is if the persons name and address are given, then the FCC can go
>right
>to the door

i don't think the fcc could go "right to your door" just on a name and address, even with a warrant.
first, they couldn't get a warrant just on a name and address.
if i knew you and we had an arguement,
does this mean that i could give your name and address out of spite to harass you?
a name and address is useful so that the fcc can go out and intercept the offending transmissions for use as evidence. then they might be able to get a warrant if nessessary.
if they were to knock on my door sometime, they would need a warrant because i believe they have the authority to inspect my station but they would have to come through my house to do it.
without a warrant, either i will bring my equipment to the porch or they will be looking at the outside of my door again.

> No, there isn't!....."
>
YES There is!! The plate & FCC ID # is on the back. The Galaxy DX-949
& 959 are the only "legal CB" "galaxy radios" They are FCC approved, are only
40ch 4W & DONT have built in echo, FM, external heatsink or channel band
switches.

his assertion makes a lot of sense.
you and your ham buddies are always bitchin' about out-bander activities but
you always side step this issue and make excuses for someone with a ticket.
your assertions always try to give the impression that hams are gold and
out-banders are lead.
well there are some hams whose gold paint is chipping and you are the first one
to run for a paint brush and either cover it up or distance yourself from them.
why don't you jump on them like you do us when they come up?
professional courtesy mr. RF sheriff???

don't forget to provide for proper cooling.
depending on how large the amp is,1 kw, 2 kw, you could concieveably use a
generic electric radiator cooling fan obtained at an auto parts store.
good luck.

one thing you might try, your spare tire mount is on a hinge.
this does not provide the best of grounds.
ideally, you would go out and get some broad wire braid, (3/4 to 1 inch wide),
and install one solder lug connector at each end keeping it as short as
possible.
connect one end to a CLEAN, (no paint), bolt that holds the spare tire mount on
and the other end to the antenna mount ground.
if this is not practical, clean the paint off the spare mount at the antenna
mount and connect the other end of the braid to the spare mount.
if you can't get broad braid, you could use the braided shield from a piece of
RG-8/U coax. NOT RG-8/ mini. it's not very broad.
good luck.

>i don't think we need to hear anymore on the subject of OUT-BAND or ILLEGAL RADIO EQUIPMENT and cb'ers here. we don't interfere with such important communications as aircraft and most police and fire freqs are way out of our range.<

I don't 'spose it would do any good to point out that (a) he was reported as "menatally disturbed", and (b) that he didn't use a "radio transmitter", per se to cause the interference. He used the harmonics from a TV cable box to create the stir.

This is not a "run-of-the-mill" ham.

And as far as enforcement issues go, you will please notice that the Congress is attempting to pass legislation to allow "local" enforcement of radio regulations due to illegal operation on 11 meters...not on 2meters, 20 meters, etc. As a matter of fact, licensed Amateurs are to be specifically exempted from any prosecution.

Personally, I hope that legislation falls flat on it's face, Ham or not...simply because the "average" cop is NOT going to know how to properly identify one radio from the next, and this can only spell trouble for ALL operators. But the fact is that an overwhelming number of the complaints besieging the FCC are the result of illegal 11 meter ops...NOT illegal Part 97 ops.

You are right that everyone has their share of kooks and ner'-do-well's. So take a valium.

>You won't regret it....I promise.
>
>

i agree with you on 99% of what you say.
you seem to be an even handed person unlike other hams that i've argued with
here lately.
as far as the ticket, i disagree.
the code is a barrier that shouldn't be required but should be optional.
i know that it's there by international treaty but that part of it should be
abandoned.
i've read here and have heard from many hams who say that once they've passed
the test, they never use it again and don't remember most of it.
if i were to get a ticket, my only interest would be voice, packet or other

technical modes of comms on hf, NOT code. i personally have no interest in vhf or uhf
the only use for code on this news group seems to be to beat cb'ers and out-banders over the head with it.
i've talked around the world on ssb at 200 watts or less on the out-bands with no problems at all.
just like the horse and buggy, there WAS a serious need for the code once upon a time but in light of technical advancements in the last 90 years, it's time to put it out to pasture and use it for recreation instead of one of the required modes of transportation for our thoughts and ideas.
even the U.S. navy and coast guard don't monitor it anymore which, from what i understand, was the orignal reason for the requirement of it in the first place.
dependable communications for ships at sea. i've not seen any tech manuals written in code which is what my main interests in radio is. the technical end of it which is what the amateur hobby needs to survive. many commerical inovations have come out of amateur radio but the younger generation takes one look at the requirements for a ticket and turn their backs because of the antiquated code.
this younger generation is one of the most technically advanced in history. my daughter in 3rd grade and has been using a computer for 3 years now.
i marvel at the thought of what she'll know when she graduates college. now multiply that by millions of kids with this knowledge getting into the amateur hobby. the possibilities are endless IF the code doesn't stand in their way and clutter their minds like so many cookies in a hard drive.
if the armed forces don't monitor it, maybe there are other dependable modes that they trust as much or more than the code. maybe we and the rest of the ITU should come into the 21st century and pull our collective heads out of the sand and see the other side of the microphone. it really does work better than it did in the 1920's.
have a good day.
jeff

3367. Difference in a 29 LTD Classic and 29 LTD Classic GOLD?

Newsgroup: rec.radio.cb

<<you always side step this issue and make excuses for someone with a ticket.
your assertions always try to give the impression that hams are gold and
out-banders are lead.>>

Jeff -- since you seem to be terribly confused,
let me outline my longstanding opinions for you:

*Outlaw hams are just as bad as outlaw CBers. Maybe worse.
*A ham ticket doesn't make someone an authority.
*There are good and bad people in both ham and CB.
*Illegal power sucks. A "big radio" does not make you a man.
*The "Freeband" is not free. If you don't like the law, change it.

It's your right to disagree. But if you are going to disagree,
at least have the facts.

Well, if you mean Spread Spectrum you might as well save your breath.
It's almost impossible to do unless you have big bucks behind you to finance the gear.

On the otherhand, I have found that I can "descramble" the encrypted 46/49MHz phones by using an all-mode receiver, switching in the lower sideband mode, then slowly tuning through the carrier.

It's certainly not high fidelity, but you'll be able to understand the conversation.

If that's where you have it mounted, then it's probably not grounded at all. So by all means....ground it. What is puzzling though is that you claim not to be receiving anything at all. You should be receiving something, even with a bad ground. Check the continuity of the feedline from the connector (part that connects to the radio) all the way through the mount (where the radiator screws into the mount). Sounds like you might have a break in continuity somewhere.

Hope this helps,
LJ

These radios come from the factory only working on CB and only do legal limit. Almost any radio can be modified to work out of band. These were made to hold to FCC standards.

I concur....Most shops charge something like $30.00 plus parts to repair a radio. So you can rapidly get to the point where you could just buy another one (used) for what it would cost you to repair the broken one if the damage is extensive. Before you throw it away though, I would check the polarity protection diode. You may have lucked out and the damage is restricted to it alone. It's an easy and cheap repair.

It is do to the immature of the people in this group & the over all CB these
days. I am sorry & will get off of this NEGATIVE newsgroup & never get on it
again! Also please do not E-MAIL me with the negative things again or what
ever & I do not want to call this 10-30 news group ever! I do not understand
it but maybe I can't. So enjoy your FLAMING & BTW I read a posting were HTML
is OK to use so who ever told me not to use it then shame on you! I am
getting out of this IMMATURE, CUSSING, NEGATIVE ATTUTIDE news group!

It may be true for Ham licensing, but it certainly is not true for
commercial/business licensing. I sent in paper forms last week for
a system I support. The notice stated that I could mail the forms,
Fax them or use the ULS. I could also pay by credit card if I wished.

Source record: 3380

I got some requests to come back on here from others so I am back on here, I am going to get back in the game & fight! As for the HTML stuff I like it! But if you all can't take it then OK, I will not do it anymore! I want to tell you all that this NEGATIVE GROUP (some) needs to go back to read the rules. the part that says NO PROFANITY! Now someone E-MAILED me to tell me to be myself & there are people on here who do not want me to use 10 codes. Got a question? CB RADIO had 10 codes & the FCC requests us to use them! So I will use them all the time along with my call letters. Also if you people on here who are ham operators want to use this then I am sorry for saying anything. Also the KCBRN club web site is coming along fine! I am adding to it & have a CB CHAT room (text & voice!)! I have not made a CB ROOM yet, But will do so soon. I am not going to bother telling you all how to act because this is wrong & if I did then I AM SORRY, see my father has German blood & Germans stick to rules 100% & I got to tell you that my father (YELLOW BIRD in the 60's & 70's) once told me that I do too much of the rules. He told me that some people do not want to bother with the FCC rules. So I am sorry, but if you do not like my 10 CODES or call letters then IGNORE IT! Just like I am trying to IGNORE the bad side of CB RADIO. So I will be on here 10-10 (on the side) & will not give in to all of your negative stupid suff. If you do not like it then this is your business as well if I do not like your alls cussing & negative comments then it is your business! I am trying as well as others to enjoy my hobby & I & others are *NOT* going to see a few people mess it up for others! Thank You!

I was told that anyone on here who wants to get in to good CLEAN, CUSSING FREE CB RADIO messages with NO MODIFICATIONS + good 10 codes as well as some good clubs then come up to the legal side of CB RADIO! Come up to http://www.onelist.com & do a search for cb radio & go 10-8 like I & others have. As 1 person said 'rec.radio.cb is the worst news group for illgeal CB he has seen.' We are a GOOD CLEAN GROUP! So set your computer to http://www.onelist.com & join us! Or you can be on here with the DIRTY SIDE. (Now I know what they mean about 'dirty side down') I am out of here!

The vertical tranformer 4 pills (Boomer Deluxe, Palomar
Elite, Palomar Deluxe, etc.) are very unstable when run
with a tuned-up 2950. The instability shows up as a
high output SWR, squealing, "fuzzy" audio, amp won't
unkey, amp runs hot, etc. Unless you like to experiment
with patch-cord lengths, antenna coax lengths, special
mounting positions, and other voodoo instability remedies,
I don't recommend running them with tuned-up 10 meter or
export radios. Stick to a brand that's known for having
reasonable stability like Texas Star, Messenger, Blue Face,
or one the better customs like Dave Made or X-Force.

Message-ID: <u%kF3.4039$Yo1.21707@newsfeed.slurp.net>
Source record: 3383

Supposing I have unlimited funds what would be the best mobile antenna
to buy for 10/11 meters? I already have a Wilson 500 and for some reason it
doesn't work right on my car. It talks good, but doesn't want to listen.
Now if the best antenna for me is a tall antenna what about a short antenna?
People have suggested a Super Penetrator, Wilson 5000, Firesticks, and even
a $50 Radio Shack penetrator look alike. What should I buy? I doubt there
is a best antenna to buy, but I need suggestions for my car. If it helps
I'm doing all of this from a small sports car.

3384. KCBRN club

CBKING is starting a new club & we (the members of WHEATON VILLAGE) have been told of this group. We here @ WHEATON VILLAGE are a private group & we support CB KING 1000% in his NEW KCBRN club! This club will be 100% better then the KCBN club & even better then CB RADIO because it will have CHAT both in text & voice. It will have 40 Channels & more. CB KING I can tell you is a great person, he has helped our village grow! (THANKS CB KING) We also want to tell you that we have been listen to some of the HASH & TRASH on CB RADIO like 19 & do not like it. Now if you all knew CBKING you will find out he is a nice person on & off the air. So do not be nasty to him & there is someone on here called toll free (strange handle) that from what CBKING has told us, is a real pain, which it is his bussiness so we will leave it alone! So this is COMPUTER KING #1 = KCMN = 20902 10-7 @ 03:06

That is a turnaround. Generally, just about any antenna will work fine on receive - if it is resonant. This is the first time I have heard of an antenna that transmits well but has poor receive. Have you tried any other antennas - to see if the receive is better?

I used to sell the Boomer Deluxe 400s and 600s. They're low-buck amps that I found to be terribly unstable in many applications--especially those involving tuned-up export or 10 meter radios. Personally, if I were you, I'd stear clear of those units. There are two glaring design flaws in those amps: First, they claim to be biased into the AB class; yet, by design, the bias is grounded out. That will cause audible distortion on SSB. Second, they use extremely high-gain transistors, yet there's no direct negative feedback to increase stability. The negative feedback that is supplied is derived in a cheap, ineffective, roundabout way. That's why those amps are unstable. The very obvious design goal as far as those amps are concerned is lowest possible parts count--which ultimately results to minimized production costs. In simple terms, the manufacturer is cutting corners in order to put out units that can be sold at prices that cut the throats of the other, more conscientious manufacturers. Do you want to support a manufacturer that plays like that? All amps aren't created equal. A 4-pill for under $200 is very appealing, but you have to see past the price.

You're on the right track wanting a 4-pill. The best production 4-pill by far is the Texas Star 500. The problem is that they aren't cheap. My customers remind me of that all the time. I tell them that sometimes you just have to suck it up and pay for it because it's worth it. There are other, cheaper 4-pills available, but none of them are in the same league as the Texas Star 500 when it comes to gain, efficiency, and output.

> great box.

I sell Pirate 4-pills that are called 500HDs. Mine are
fully featured and biased to Class B so that they sound
right on sideband. They're nice amps, and the price is
decent, but they won't keep up with a Texas Star 500 when
it comes to power. The ones I sell use SD1446 transistors.
I've also had them built using 2SC2879s which drive the
price WAY up. Even with the 2879s, the gain, efficiency,
and output are not at all on par with the Texas Star 500.

In my opinion, there's only one choice in production 4-pills
when you want maximum performance: the Texas Star 500.

>IF the legislation passes the cop that bangs on your door will prbably have some special training(It wouldn't take much). BTW one thing the FCC really responds to in a hurry is an interference report from the FAA.<

I agree about the FAA getting ASAPservice from the FCC, and it should. Nothing more embarrasssing than a 747 full of people plowing into a mountain top because of a navigational error induced by a faulty NAVAID signal.

But as far as the "special training", there's no way that they can invest enough training in eveery cop to recognize every possible variant of a radio that might be used.

I personally own two 11 meter rigs converted to 10 meters (and ONLY 10 meters), but I also own an 11 meter SSB rig (stock). There's no way that John Q. Law is going to be thouroughly versed on what's a legit modification and what's a bogus switch.

Between burying my Dad and one of my kids this year, I have had enough bad luck without having to spend money on a lawyer to get my legally modified radios back from some over-zealous Radio Rambo.

If you read the ham NG and/or QST, you will find that the fellow in question
was condemned across the board by the Amateur community.

Hams have plenty to say about those who break the regulations, and hams often
are the ones who help solve the case.

>RF police hams are always
>pointing at our pile while ignoring the heap behind them.

You are flat wrong on this one. Find another topic.

>the Palomar 225's

No it is on a switch.

> How about the preamp ? Can it be used without the amp
>turned on ?

Yes it has a pretty good pre amp and it can be used with out the amp being on.
I saw a couple of replys to this that recommended you drive the amp with a
modulator. You can do this with the 500 R,but Not with the 500 V (variable).
You will find that you burn out the variable pots and the amp wont work right.

It is an oxymoron. There are no 'out bands', just bands assigned and
rarely used. By using these assigned bands, you may or may not interfere
with other services, but for certain, you have the potential for
interference, and THAT is the point. Interference to another service
with a clean radio is still interference.

PLLO2A wrote:

You must be a moron. If you don't like the thread, just go on to something else. New people come here all the time and ask inane questions only a person very new to radio or electronics in general would ask. From this it is easy to deduce that they have no idea what Part 95 is, let alone have read it. So, put a cork in it and go on. The intent of most informational posts is to be====informational. Beyond that, you likely should drop your spare quarters in the coffee can to save up for the attorney's fees you will eventually pay for your dumb-ass actions.

well I'm not interested in VHF.... thats what makes HAM radio so
good....there is something for everyone...

its funny but I hardly ever work VHF and yet I have 2 repeaters operating
one at 147.0 and one at 146.61 the 147 is the hottest repeater in the
state. setting at 2050 feet...average terrain is about 900 ft.
but I'm an HF freak....You can find me on HF anyday.....14.193
give me a shout if the band is open

>this is in the phone portion of the band, well into 10m!!

In my opinion, this is even worse than "accidental" encroachment. These clowns knew full well where they were. They were purposely bootlegging in the phone portion of the band!

I have encountered and confronted this type of operator. Their attitude is typically much different than those found around 28.000-28.100. Whereas the "encroacher" will usually aploogize, say "I didn't know", and move back below 28Mhz when asked politely, the deliberate bootleggers in the phone band will respond with "so what?" or worse. They will basically dare you to "do something about it." Then, they either ignore you or turn up their linears and continue their conversations. There is absolutely no justification for this kind of behavior.

Hello,
I have been selling on Ebay and the prices on some things just cost to much to sell there, So I have another auction site I have moved some of my stuff to, Its called Up State Auctions and there new and trying to get started. I have spoke to the owner several time and he is a nice guy to deal with. I am looking for a place to do some swap, sell, dealing and trading other than ebay. If you get the opportunity stop by at the link I have place below and have a look at my stuff and look around, and list some of your stuff... I do have a bunch of new radio's and accessories I am selling at well below retail value. I am not a dealer I do this for a hobby, for the last 30 years..I will also place a link to me on ebay and you can check my feed back rating..I am letting the items listed on ebay run out and them my realist a few..
Thanks for your time.
Alan.

I have a Jeep Cherokee and a Cobra 18 WX ST CB.

What's the best antenna I can get? How much $$?
I'm thinking of mounting the CB antenna across from the AM/FM Radio antenna on the hood.
So it would be on the driver's side.
How long of a cable should I run? Would running a shorter coaxial cable reduce the loss of power?

I would go with a Wilson 1000 magnet mount on the roof of the Jeep. That way you don't have to unscrew a whip type antenna all of the time. This antenna comes with its own coax and it sells at www.copper.com for about $60.

CONFESSION: I really was trying too hard to make CB RADIO the way it was & I saw some web pages + onelist.com & this news group as well as other SSB stuff. I also saw pictures of radios as well as REACT web sites & thought to my self that CB RADIO is like HAM with people talking about different things & I also thought that using codes was in too. But I do not know how CB RADIO (AM/SSB) is today everywhere. But where I live the air waves are full of bad manners & anything goes. No FCC rules or respect & no 10 CODES or breaks or any of the good CBers of the past. I am ashamed on how people do not care & how people are letting anything go. Something to think about: What if YOU are on the radio & had to get on for an emergency & had no cell/car phone & no one heard you. Would you want be left for dead or would you want help? Think about people you love like your family? They care about you even if you don't! THINK ABOUT IT!

Hello,
I am new to CB'ing, but after lurking here for a couple a
months, Ive decided to purchase one. Ive narrowed my two choices down
to the cobra 148gtl or uniden grant.
Which one is better? what are the pros and cons of each? I'm
relatively inexperienced here so any input would be helpful.
TIA

Robert, I think you need to understand that the serious radio people, who were observant of rules and proper decorum, either migrated to amateur or dropped out entirely many years ago. The vast majority of folks using CB today are over the road drivers and other blue collars who spend a great deal of time on the road. Just listen. Remember--there is absolutely no training required to operate a CB. I'm not saying this is wrong, just a fact. As a result, everyone is on their own to develop their style of operation, and their mentors are those they hear on the air. The net result is:
1. people are untrained and share few common protocols
2. people are anonymous and this anonymity permits them to behave in ways that would shame their mothers
3. few are actually aware of the rules under which they operate
4. there is a high level of disdain for rules and regulations
5. without any visible regulation, the quality tends to spiral downward

I was curious if you could build me one of your super amps, I would like to get a 91 pill, I dont need no combiner's, just tie all the inputs & outputs together. Also is there any way you can invent me your own style of biasing for the transistors? maybe a class Y2K configuration, that way it will be ready for the future. Also dont worry about efficiency, I have a big Cadillac alternator to power this puppy. And can I drive this with a galaxy 30?

Damn 10 ohm smoke
Sure make you choke
Da more dat smoke
Da more ya broke
Damn dat 10 ohm smoke!!!

Their are a couple things that you do to the input.

I redo the variable circuit to get the thing to act as a modulator. This will increase the PEP values, while still being able to run full throttle open for SSB use.

Then, redo the power wires, and that will give you a hundred or more watts alone.

Take the fuses out of the back and bypass them. That is worth more than 50 watts under high drive conditions.

Their are other mods, but those should be done by people with the proper test equipment, as they involve tuning the amps (each is a little different) for the best performance.

That entirely depends on the amplifier.

The amount of capacitance and turns on the output transformer (and to a little bit, the material the transformer torroids are made of... Mix) delegate the max volts.

Yes, it is.

The amateur (read that as the ARRL) community has a lot more money than the CBers...

The ARRL has good reason to keep the CW their... It makes it so that someone has to accomplish something before they could get HF rights.

If they opened up a No-Code hobbyist band, then what good would the ARRL be?

And, do you think that the Boston Tea Party was done while they where petitioning Parliament?

Jack,

Sounds like I hit it on the head; down to your pulling out the
dictionary. The definition from your posts seems to fit very well.
What I was getting at was that it had already been established that the
949 and the 959 had the FCC labels on the back. Perhaps you question
whether Galaxy is putting fake labels on the back of the 949 and 959.
Anyway, Lighten up Jack; leave your socks in the middle of the floor one
time just for the heck of it. Have a great day! Jon.

Agreed on all parts.

I never operate above 27.9, just because I don't want to interfere with 10 meters (I have a 10 meter neighbor that says when I operate on the extreme high end of the band I take out the area he works...?)

I like all three services.. CB, Amateur and the "freeband".

Can't we all just get along?

I agree completely. THAT is what ham radio is all about.
Getting a ham ticket doesn't make one person better than
another--it just opens doors into other areas of the radio
hobby.

> its funny but I hardly ever work VHF and yet I have 2 repeaters operating

If this is aimed at me, it'll never happen because I'm
not licensed to operate on 14 megs--and I don't bootleg.
You and I will have to communicate via the Internet. My
e-mail door is always open.

There are a number of antennas that are supposed to beat the mighty
quarterwave. Along with the Xterminator is the Stargun "Bopper"
among others. I feel the same way you do; I need to see it to believe
it. I'm on the west coast; none of these antennas are commonly
available out here, so I don't see them and never get a chance to
evaluate them. If I did, and found that they were better, I'd wouldn't
have a problem admitting it. I'm not particularly in love with the
quarterwave, it's just that I've never personally seen anything that's
any better. Keep in mind that cost effectiveness plays a part in my
equation. Some of these "high tech" antennas are very expensive when
when compared to a $15 quarterwave. The question I often ask is
whether these "better than a quarterwave" antennas are so much better
that they should command prices that are 5 to 10 times more than a
quarterwave. Even given the claims I've heard, I can never say "yes"
to that question. In other words, in the bang-for-the-buck catagory,
the quarterwave is still the hands down champion.

I'd like to know what that is too. I hope it's
not what I think it is (bypassing the modulator).
I've seen that done to 2950s. It gets you some
higher output numbers, but it's a radical mod
that I don't trust. The radios that incorporate
it tend to be unstable.

I prefer the 500 as a stand-alone amp (no modulator either built-in
like the 667 or outboard). The 500 by itself has tremendous gain and
good linearity. In other words, it sounds excellent with just a radio
as a driver because you're only running one linear amp stage (more
amp stages mean more distortion), and the amp is AB biased (no class c
modulators to add distortion) or extra built-in AB class driver
stages (aka the 667) to add extra stage and overdrive distortion to
your SSB sound. In a nutshell, the 500 and a sweet-sounding, hi-end
AM/SSB radio is a helluva nice package for the majority of CBers.

3486. Texas Star 667V... Price Reduction

Newsgroup: rec.radio.cb
Date: 1999-09-21 00:00:00 UTC
From: Professor <bgriffey@kwom.com>
Message-ID: <kqUF3.2021$QJ.77293@typ11.nn.bcandid.com>
Source record: 3586

Let it never be said that the old professor doesn't give the best deals around!

Brand New in unopened box. Will modify if requested for no charge.
Price includes shipping via UPS ground within continental US.
$350

These are excellent (if not the best!) units with one driving four. They are class AB and designed to work great on SSB. The output expected should be around 550+ Watts peak.

Email me to make arrangements...

What makes it bulletproof is not abusing it by demanding too much
out of it.

To me, "bulletproof" means reliable. Reliability and maximum possible
output are diametric opposites. Just because a 4 pill can make 1600
or more watts in competition, you shouldn't expect anything like that
in daily, low-voltage use. 667s make 500 to 550 peak watts at 12 volts
with 148s driving them. Don't expect more than that, and you won't be
abusing your amp.

It'll sound as good as your radio sounds--that's the point
of running a 500 with only a radio as a driver. The point
isn't to get every peak watt out of the amp, it's to make
alot more power than you had using a 225 and to actually
sound better and be a more reliable set-up. E-mail me.
I'll send you a 500 on a trial basis. If you don't like
it, send it back. All you'll be out is the shipping unless
the amp is damaged to the point where it can't be sold as
new. In other words, if you can afford it, do it--you
won't be disappointed. There are others that sell 500s
for less than I do. If you're ready to make the commitment,
buy from one of them. My deal means you have to pay my
price plus shipping both ways before I send you the amp.
If you like it, I refund half the shipping price. If you
don't, when I get the amp back in resaleable condition, I
refund the purchase price of the amp. In simple terms, you
pay the shipping both ways plus any damage you do to the amp.
That's the best I can do. I really believe in the Texas Star
500 or I wouldn't make an offer like this. The smartest
thing for you to do is to just go to a place like Exports
R Us and buy one as cheaply as possible. Given what I've
offered you here, you know for a fact you won't regret it.

I have seen 800 watts out of mine in daily talking for about 5 years.

Would that be reliable?

It will also do 1100 or more, but that is for short keys...

For my Midland 79-290, I already considered the channelguard. I was told
that it would not work in this radio as it is not modifiable in that area, a
real shame. Do you know otherwise?

Dale.

3497. Re: Texas Star 500 ?

Newsgroup: rec.radio.cb
Date: 1999-09-21 00:00:00 UTC
From: Bill Eitner <kd6tas@netzero.net>
Message-ID: <37E821CE.B5778D79@netzero.net>
Source record: 3597

I agree completely.

My whole point is to use it as a stand-alone amp because it'll sound great and produce impressive (and reliable) output numbers.

Here's how it works (mark my words here): anyone who isn't using anything bigger successfully (and I mean successfully--there are alot of bigger systems that just don't work right floating around) can upgrade to a Texas Star 500 and will be guaranteed greater CB success regardless of what success means to that person. Think about it. My offer extends to everyone. I sell 500Rs for $375--they're worth every dime. You send me $375 plus $30 for insured shipping both ways, and I'll send you one on a 30 day trial basis. If you don't like it and you send it back, I'll send you your $375 as long as you send me an amp I can sell as new. If it has holes or scratches or doesn't test properly (I have all the test equipment and know-how--you won't fool me) I will reduce your refund by the amount it takes to repair the amp. I don't work cheap, so it's not in your best interests to abuse the amp. This is also a Black Market deal so just assume that I have more muscle on tap than you do. You send me back an old pile of shit you won't get a dime back. You get pissed about it and knock on my door, I'll personally beat you with a baseball bat. I have a zero tolerance for scumbag losers who try to beat the system. This is an honest deal as far as Black Market deals go.

The point of all of this is that the Texas Star 500 is a great amp, and that every serious CBer should have at least owned one at one time. You can't lose on this unless you're successfully running a bigger system right now. You can also buy one for alot cheaper than I sell them for. I recommend that you do that. You have to believe that they're good. That's the whole point of my effort here. I'm telling you that you can't lose by buying one. I really don't want you to buy one from me because I only like dealing with walk-in (local) customers. I'm begging you to buy one, but not from me even though I sell them--what could be a better testimonial?

73 to all.

If there new the GrantXL is your best bet its a better radio. If there used
then and older i would go with the Cobra they were hand wired then and had a
better recieve then. the Grant will tune up better than the Cobra
as far as output goes. Hope this helps 73s Oldtimer

I think the 520 is a little better deal.The 520 has a noise blanker,pa
and ext. speaker jacks where the 510 doesn't have. I do also agree with
the other fellows response about the 510 though. 510&520's are both
good. I have sold many of each.
I do want to add though be carefull with the refurbs as there is only
about a $10.00 savings and 1 one month warranty.
The refurbishing is done by some outfit in California that does car
stereos,scanners,cb's etc. They don't come with the original box and
come with either a photocopy manual or sometimes none.
My suggestion is New Product. Mike.....

According to federal law, it is.

That was the reason that Video Inversion was considered "Undecipherable"
during the cable TV heyday..

Although you could just tune a couple Kcs away from the center of the
carrier freq and get a useable picture...

Not a great one, but useable.

This was also illegal, as it was considered "Decryption and theft of cable
tv signal".

Tinker wrote:
>
> I was just wondering what class works best with A.M. and SSB . Or if all of
> them will work but some may sound better than others.
> Sorry for too such of a broad question.
> Tinker

I'll reply in terms that apply to CBers in general.

As far as power output with solid-state amps, Class C (unbiased) works best. With SSB, Class B works best. Some may say that Class AB is better, but that's only because they haven't seen the latest, leading-edge research. On the other hand, Class C (technically unbiased) will produce a readable signal even on SSB because unbiased solid-state CB amps do not run with any applied negative bias which would make them true Class C amps. See how complicated this can get?

In a nutshell, for SSB use, you're better off with an amp that's biased into linearity. That means at least Class B.

This doesn't even skim the top of the huge iceberg that makes up the debate that's been going on as long as I've been out here (3 years) about amplifier class. That's why the big guns out here (including myself) don't even want to get started on this again.

Here's the scoop as far as CBers are concerned: The best amplifiers (Dave Made, etc.) run in Class C (un-biased) with a driver stage to produce more modulation. On SSB, the same amp switches to Class B or AB and bypasses the driver stage to increase linearity (accuracy of amplification) and minimize distortion. This assumes amps of no more than 8 transistors in the output stage. See how this works? No bias (technically Class C) and a ton of drive and DC supply voltage are the keys to doing well on AM. On SSB it's an entirely different story. The drive has to be reduced and the bias has to be present for an amp to sound as best it can on SSB.

This may be confusing, but it's the best I'm willing to offer and back up (undoubtedly I'll be challenged).

You "Tinker" but you don't know the price you ask others
to pay in order to play your game. This is a complex
newsgroup where arguments and debates flare up over the
most minor points. What looks like a simple question
can blow up into a huge argument/debate.

O.K. I've read all that you and Toll Free have had to say about this. Texas Star 500 is one of the best for someone like me who does not want to have to go out and spend a lot of money on extra voltage, wiring and all that other good stuff.

What would you pair this amp with. I've used Cobra's and Galaxy's but am open for suggestions. I got out of CB'ing here in my local area because of all the wild ones that tear up the channels but I sure have missed it and am considering jumping back in.

Last setup I had was the Galaxy 73V, Palamar 650, Wilson 1000 mag mount. Was happy with it but I did have problems mentioned in previous post about amp not wanting to unkey. {real pain in the ass to reach back and turn it off and back on just to talk).

Thanks.

Yep, I plan to BE MYSELF instead of getting everyone upset @ me. I found out that it is not fun to keep "hashing n' trashing" OLD NEWS. If people on here want to act up or cuss this is their business. Besides I do not know if it was you or someone else, but someone told me they do not like people that talk about the same thing all of the time. I am not saying that I will stay in the group. Just checking in to see if there are any replies, & to try to be "funny" with that 'pick the nose bit" if it is not funny then I am sorry.

If you like the Galaxy line, the 88 is about the best.

If you like the legal line of CB radios, then the Uniden 8719 chassis (148, Grant, etc.) are the best.

I typically see more Bird watts from a Cobra 148 than I do a Galaxy, but the Galaxy will do more on SSB clearly.

NOW MTV really "SUCKS" & I am trying to get them off the air & the FCC is looking in to them. Remember DC101 & the "grease man" all the trouble he got in to for cussing & talking about sex on the air. Maybe this is were everyone got the idea to mess CB RADIO up. Can we CBer's sew him for that?

3517. Re: Class A,B, or C Amps

Newsgroup: rec.radio.cb
Date: 1999-09-21 00:00:00 UTC
From: Andrew Taylor <drewtay@bellsouth.net>
Message-ID: <37E83D81.1E7EA6FA@bellsouth.net>
Source record: 3617

Doesn't really matter to me. I can say, even if it isn't right, the Galaxy helped here in my area because of all the clutter. I could find a channel to talk on without excessive bleed from other people nearby. And there were enough with SSB that even there they sometimes managed to screw it up.

Bottom line, one time purchase, best setup available without having to rewire automobile, and ability for SSB and possible others.

Off the subject or to change the subject. Can the Galaxy be used as 10 meter after conversion. If one should ever have a desire to get licensed.

need information on this subject....
got a realistic cd
installed a noise filter fro radio shack

drive a 1981 buick and i am stupid about how much ignition noise there
should be...can hear whine when i accelerate

3520. Re: Texas Star Modulator V-Plus

If the wattage is changing with frequency, you're not running into a
dummy load and you should expect increased inaccuracy.

If you hear a whine when you accelerate, one of two things are happening...

A. Your battery sucks.
B. You have a bad ground somewhere.

You should NEVER have to use a noise filter to get rid of a whine in the alternator (which is what you are seeing.... Not ignition noise. Ignition makes a popping sound. Alternators whine.)

I have a Texas Ranger 696F ssb base for sale. It has been modified with extras. This rig has a six digit freq counter, talkback, a 5 tone doorbell added , and an open clarifier. I have all reciepts for this radio. I bought it new 5 months ago and hardly used it. This rig has maybe 10 hours of talktime on it. I am asking 300 dollars with shipping costs included. I spent 350 just for the radio from Copper Electronics. Thank you all for looking at this ad. Email me with interests or questions.

Yes, the Galaxy's will cover the entire 10 meter band down to 25 megs.

If for some reason you desire 12 meters, 11 meters and 10 meters, and a better RX section, get one of the Connex 4800DX radios, or the Cobra 148 Export radios (The 12 banders).

They have a new board in them that is supposed to kick ass.

>
> What would you pair this amp with.

You haven't read all the recent posts on this subject. The
dual final radios (10 meter/exports) are a great match to
the Texas Star 500. In my neck of the woods, it's like
bread and butter; you buy a big Galaxy or a 2950 and the
natural match for it is a Texas Star 500. The same goes
for the guys who know what the hot AM-only radios are
(Uniden 66, 76, Cobra 25, 29).

> I've used Cobra's and Galaxy's but am open
> for suggestions. I got out of CB'ing here in my local area because of all the

> jumping back in.

Nothing has changed. If anything it's gotten worse.
Don't get back in if you think the trouble makers are
gone--they aren't.

> Last setup I had was the Galaxy 73V, Palamar 650, Wilson 1000 mag mount. Was
> happy with it but I did have problems mentioned in previous post about amp not
> wanting to unkey. {real pain in the ass to reach back and turn it off and back
> on just to talk).

The amp was unstable. This time, buy a stable amp like the
Texas Star 500, a Messenger M4V, or a good custom like a
Dave Made or X-Force M200. Also, make sure you have enough
charging system to cover it. For the amps mentioned we're
talking a 100+ amp alternator at least. A real antenna
ground (not a mag-mount) helps tremendously too. The rule
is that serious, hi-power CBers NEVER use mag-mounts.

To make sure the amp is stable, put an SWR meter right at
the output of the amp. Make the SWR as low as it can be
with the amp off, then turn the amp on and recheck. The
SWR will almost always rise, but it shouldn't be in the
red (above 3:1). If it is, the amp is unstable and you'll
have to figure out why and correct the problem before you
use the amp. I can help you with that, but I'd rather do
that via e-mail as it can get complicated. One of the

obvious reasons is that your antenna (aka RF) ground is
inadequate because you're using a mag-mount (remember
your old system and don't do that again).

The antenna you are talking about is made in Spain I believe, it is piece of junk, it will fall apart on you and a lot of the parts will crack, and yes it is 32' long for about a month, until the stinger falls out on the ground, I have heard ALOT of bad reports on these. They are nothing like the sigma 4, only in looks from the ground.

Damn 10 ohm smoke
Sure make you choke
Da more dat smoke
Da more ya broke
Damn dat 10 ohm smoke!!!

I notice everyone seems to like the TS 500v. I do too, as I have used one the last two years. My question is I am wondering what the opinions of the Messengers are now days. I am seriously thinking of getting a sweet sixteen but am also considering the 8 pill Messenger. Anyone have any experience for my comparision. I will put it in my truck, PU, with dual batteries and a 175 amp Alt. I use #"0" welding cable to connect the batteries and #"2" welding cable to connect to the amp which is behing the rear seat in the 4 door dually.

My radio is a 2950 and sometimes a 2510. I am not as much interested in every last watt as a good clear signal on SSB. Thanks in advance.

Now what is the big deal about putting the Ham's down? "Most" ham operaters on the proper equimpent, as we know there are some that don't. FCC mostly takes care of them.

I would have no problem if the serious 11 meter ops were to clean up Children's Band, and/or 11 meter.
I wouldn't mind if they went back to the old setup, as in issuing license to every CB user(or hopefully all 11 meter). I am getting sick of all the bad stupid language, for no reason.

I think all the serious 11 meter ops are on the freeband because of
the deplorable state of the "legal 40". Also, wasn't the guy who
caused the interference using something other than a CB radio?

If you can hear engine noise in your cd player, try cleaning the
connections on the plug wires or checking their resistance and replace
them if the resistance is noticably high. Use resistor spark plugs.

(BEFORE PROCEEDING READ THE MATERIAL FULLY THROUGH TO MAYBE PINPOINT OR FIND A COUPLE OF AREAS
THAT MIGHT HELP CLEAR YOUR RECEIVE)

Oh S*&T don't use that word pro!@#$%^&*ls. It will go to there head.

Take the antenna off and turn the volume up on the radio loud and listen to hear
for the same noise if the noise is still there it's coming in via the antenna. And if
thats the case, you probably bought the 25 or 30 dollar magmount and thoughs things no matter
how flat of a match you get they just pull in all sorts of static noise. I had one for a while
when I got a new vehicle. Cause I wasn't gonna hard mount it, and that antenna was picking up
static noise off of my tires going down the road. If thats the case get a new antenna. I prefer
my Fire Stick II matches up well with radio and has a very quiet receive. I need that cause
friends and I have Rabbit hunts every weekend and we hunt in a hilly terrain and you need to
hear those faint signals. Any ways enough with that stuff about my self.

First things first we'll try with the easy fixes and get more in depth.

Does your alternator have a capcitor used for filtering the (I do beleive for the
field) if so make sure it's tight and got a good ground. Or get your alternator tested
to see if a rectifier has gone bad.

Getting the power to the radio:
Second Is your radio getting it's power from the fuse panel in your car? If so remove it. Run the power wire directly from your battery (Positve lead). If for a purpose I'll explain later you can use Coax as a power wire use the inner conductor for power, and take both ends of the shield and mount it to the cars chassis frame. do not use the shield for a power ground. Use a seperate ground wire off the the radio (expalined below). Route all power wires as far away from the ignition wires as possible in the engine compartment. And away from any electrical motors, They are the worst offenderds
of noise. I've driven down the highway on a rainy day and have had cars pass me and I could hear
there windshield wiper motors in my receive. (so I tail gated them took down their liceince plate number and reported them to the FCC for Bleed over! Just Kidding.)

Finding a good ground:
The negative lead needs to be as short as possible, preferrably 18" or shorter. Find a big piece of metal to mount the ground to, and make sure the metal is not isolated from your bus chassis ground. To check this use a Digital Multi. meter or volt/ohm meter and stick one lead to a peice of metal on the car. If you have long enough leads touch the Negative battery post and touch the piece of metal you want to hook your ground to. If it reads .1 ohms or lower you should have a damn fine ground.

Ground wire connection:
Now before you crimp on a ring connector and get a sheet metal self tapping screw (I prefer a Nyloc Nut and bolt). Take some time first to use a wire brush or sand paper to remove the paint or primer off. Make sure you have a clean metal to metal contact. Thats the mistake a lot of DIY installers of 12V electrics make. Now mount the connector (ring, spade, etc.) down with the fastener. Now if you want to prevent rust or corrosion, you can get some paint and spray it over the connecton.

Now that you have a good clean install that should eleminate a majority of noise induced by the cars electrical system. If there is still alot of noise well look into the vehicles ignition system. if you have old decrepid ignition wires you might think about getting new ones. This could be the culprit. Get resistor plugs and wires this helps suppress ignition noise.

Now if that doesn't clean up the problem take it to a cb shop and see if your noise blankiting
circuit is outta whack or something. Or go ahead and try a noise filter.

If any one has any other ideas or technique that helps to eliminate receive noise post it or
flame me for what I wrote feel free. "Cause I don't ware my feelings on my shirt sleeve, so my
feelings wont be hurt"

3548. 99 Taurus - need antenna suggestions

Newsgroup: rec.radio.cb
Date: 1999-09-22 00:00:00 UTC
From: amyhughes@my-deja.com
Message-ID: <7sb32vifb1@nnrp1.deja.com>
Source record: 3466

The only place flat enough to hold my magnetic mount on my 99 Taurus is on the very top. I'm not very tall and I don't like long external cable runs so I'd like suggestions on what other mounts will work. What are other Taurus owners using?

A permanent mount is okay but I'd prefer not to drill any holes. I don't need the antenna to be the longest-range and optimally located for best transmission since the radio is only used for playing with truckers that are fairly close to me :-)

As far as I can tell the trunk lid is plastic.

Thanks,
Amy

Why not just look it up yourself?

Take the information from the sticker that's on their website at <http://www.galaxyradios.com/cb/949.html>, and do a search on the FCC site at <http://www.fcc.gov/searchtools.html> using the FCC ID# Search.

Might be a good idea to check the equipment you've got around the house while you're at it, just to be on the safe side.

Howdy, I'm new here. I have a problem. I got stuck in a traffic jam on the interstate in the middle of a group of semis. I think one of the guys(or it could have been anyone I guess) was using a modified radio or something, he was just drowning out everyone. Anyway, after he keyed up and before I could drop my squelch, I just stopped receiving. At first I thought the whole radio was fried, but I still transmit (I checked via phone, my friend could hear me-loud and clear same as always-, but I can't hear him), Has this ever happened to anyone? And is there a way to fix it? Thanks in advance for any help. Dan

If it talks good it can't be a antenna problem, try it on a other radio or try a other antenna, if you have a antenna problem it will (in most cases) recieve good but talk poor.

>I think all the serious 11 meter ops are on the freeband because of the deplorable state of the "legal 40". Also, wasn't the guy who caused the interference using something other than a CB radio?<

Who cares WHAT he's using for an exciter? Illegal is illegal, wether it's some jerkwad with a linear on the legal 40 with an otherwise legal radio playing music and jamming the legit users, or if it's one of those creeps in the megawatt mobiles?

It all boils down to this: By doing so they create QRM and frustration for thousands upon thousands of people who want to use CB but have their own rights trashed by a selfish and arrogant few.

I have a amped-up radio in my car. (I know I know....I don't play it that loud.) I have been getting really bad interference when I am around my home. Anytime I am about 2 blocks from my home I get what sounds like garbled talking BOOMing through my stereo. Sometimes there is no one talking just a loud silence that sounds like it will bust my speakers.(hard to explain) I get a little on my home stereo but I can't be sure its the same thing.

First: Can I filter something to stop this from coming through? (I would have to have someone do it for me)

Second: Is there a law that should stop this from happening?

There are no Antennas around my neighborhood that I can see. Is this a CB or a HAM?
Third: If it is a HAM is there a HAM organization that could help me out about this?

Source record: 3503

We've been over this already.

The 600HD is a vertical transformer amp like the Boomer Deluxe 400.
Those amps are unstable--especially when run with 10 meter/export
radios that use high-gain RF output transistors like the 2SC2312
or the MRF477. The 600 is a worse mistake than the 400. It has
a driver stage which means it's prone to overdrive, yet it hardly
makes any more power than the 400. It's even more unstable than
the 400. The last one of those that I sold went to a guy with a
2950. We never got it to work right. It wouldn't unkey and his TX
audio was fuzzy and contained an audible squeal. I added feedback
to the amp and the radio, and filtering to the mic. That didn't
change it at all. The guy wanted a clean installation, so he didn't
want to play with mounting locations or antenna/patch cord lengths.
In the end, the guy switched to a 148 just so the amp would work.

The cheap price is the ONLY thing that's good about those amps.

If you want to save some money, still be in the 4-pill class, and
own a stable, top-quality amp, get a Blue Face (will say "Magnum by
Palomar" on the front face) 450. It won't keep up with the Texas Star
power-wise, but it's overall design, stability and build quality are
better, in my opinion.

OK, lets make sure we get that slim sharp razor out and split these hairs evenly........The HTX-10 won't be "easily modifyable" in the "normal" sense that somone can move a jumper/ add a resistor & the radio displays & operates on the CB band, but a "qualified" somone probably can change a lot of coils, caps& xtal ect & get the radio to operate on 27Mhz or other nearby freqt, but the radio does not have a real freq counter, so it will still only display 10M freqs since the microprocessor & display driver chips are hardwired by their "internal design" for 10M only. Most people asking if the HTX-10 can be modified really mean "like other export & 10M rigs", the ones that are actually built & designed w/ chips & display drivers that allow full 26-30 use,which are then actually "blocked" or "modified" by the factory for 10M only operation so that they can be legally imported, & then are "restored" back to the original full freq design by a simple "mod".
The HTX-10's "brain" is not a blocked full 10/11M design, unlike similar looking radios from "export" mfgrs & dealers.

Unfortunately, it's more than just a "few". The selfish and arrogant seem to be in the majority these days. These people have no apologies or regrets for their actions, and will defend them to the death to those of us that point out the error in their ways. "Yea, I'm illegal! So what! Do something about it or be quiet".

Used to be a time when you "bent" the rules a bit to make the hobby a little more interesting, and less confining. But once you start that trip, the amount of bending just gets greater and greater. To the point that you don't follow any rules. The suggestion that there ARE still rules, brings on such a retort, that you'd think that you just suggested that we all sit in church every day, and never watch a dirty movie ever again.

There used to be a middle ground. The original CB service rules, never intended for the band to be used as a hobby band. A few rules bent and once that changed, CB was a neat and relatively cheap radio hobby, that didn't require the dedication and know-how that the ham radio service required, with the added bonus of a more interesting and diverse group of people to talk with. People were technically running illegally, but they still conducted themselves with some respect and consideration for other people. But now the band has gone too far. It's total chaos now. Every man for himself, and the hell with everyone else. I'd never want to expose my kids to the type of behaviour that's typical on CB. The fact that many people defend this type of lawless, no respect

behaviour, says more about the state of our society in general, than just a CB problem.

There are several things going here, and I will try to answer your questions. The amplifier on your stereo amplifies anything that gets on it's wiring system, so it must be working well. First, There probably is something you can do at your end to kill the interference, but you need to try and locate the source of the noise first. This goes to the second question. The interference you are experiencing may or may not be legal. It depends upon its source. Remember that your stereo is a Part 15 device and must tolerate any legitimate outside interference. When you start screwing around with amplifiers and speakers, well, things happen that the manufacturer didn't anticipate. Yes, contact your local amateur radio organization and they can help you. I'd give you more direction here, but you didn't indicate where you live, and you used one of those >>FAKE ADDRESSES<< that we all love, so it isn't possible to send info to you directly. If the noise is fairly continuous, it is unlikely that the source is either CB or amateur. Good possibilities would be the CATV system in the area, local cell phone/pager systems, industrial comm systems....

Close proximnity to another transmitter running legal power would never have affected your rig the way it did. Open the box and check to see if any of the components appear to be fried; it may have wiped an ic/transistor in the receive section.

This is another good example to prove that guys who run excessive power levels never bother other CBers. =:-)

It has nothing to do with legal or illegal radio operation. The CB and Ham bands are a reflection of the moral decay of our society. Everyone for himself and screw the neighbors wife.

The professor is going to have to sell his radios, then his TV's and eventually move to the mountain top to escape it. But the mountain tops are getting crowded so he better hurry.

Ok here is the deal . . .

Tell me where . . .

I will fly to the location

rent a pickup truck w/fiberglass camper shell

you supply me a radio 2 watt dead key min . . .

I will supply the rest of the system

no batteries, no altenators

and no antenna (aerial type)

I will take your system out within the 10 second window
and you will dig deep in your pockets to key again

We must invite TollFree along for the video as well as referee
LOL

Brass

Hello all!
I was wondering if anybody worked the Island of Grenada this morning around 7:30 central time?
I listened on 27.385 LSB (Ch. 38) before leaving for work, and I heard a station calling CQ DX with a "West Indies" accent.
I was surprised that I was able to reach him with my stock 148GTL.
I've worked the West Indies before, (Puerto Rico, Jamaica, Bahamas, Etc.) but I've never worked Grenada before. It was pretty exciting working an island I've never worked before. Being heard that far away with a TRULLY STOCK 148GTL made my day, let me tell ya!!!!

Thanks for reading my babbling, I had to tell someone!!!

Hello Bronco Dan: It sounds like the first transistor in the receivers front end called a RF Amp, might have been damaged or burned up.

The transistor should be easily replaced, and protection diodes added to protect the receivers front end first RF Amp transistor.

I had a old Johnson 123, that would smoke off, even when the wind changed direction. But after installing the protection diodes, it never blew up again. A good Tech should know how to fix this for you.

Don't pay to much attention to Glen or Gary, I'd bet they would complain ifin they was to be hung with a new rope.

Jay at jay123a@qnet.com .... Listening to Rock & Roll music in the Great Mojave Desert, just down the road ah ways from the fillin station. A good friend to Big Bob, famous CB'er and flossifier. Big Bob would says things like: "Even ifin some folks got new clothes, a fine shotgun, and a full jug, like in Hillbilly Dave's web site, they would be ah complaining as if whinin would pay the bills"

> energy.

The problem with that is that it's only true in theory.
Reality paints a different picture. Most S-meters are
wide open at the low end and compressed at the high end.
In other words, an extra 10 watts when you're already
running a hundred may be all it takes to raise your
signal an s-unit when you're at S-0. On the other hand,
it may take 10 times more power to raise your signal
from S-8 to S-9. And, when it comes to getting on top
of a pile-up or even a two signal heterodyne, a mere
25 extra watts when you're already running 100 is all
it takes.

Too many people simply regurgitate book theory without
ever testing it. I used to be guilty of that. Other
guys like me used to tell guys like you the same thing
I'm telling you. The reasons why some things that may
seem like myths to you never die is because they really
aren't myths.

Congratulations,DX is the funnest part of radio for me,and one of the
2 main reasons I got my xtra class amateur ticket.Lots more DX,lots more
freqs,more modes,cooler rigs,and a lot more organization.
I specialize in collecting QSL cards from islands.Many of these islands
are uninhabited and a few operators form a "DXpedition"to get the island
on the air.So far after about 4 years I have about 196 countries
confirmed with a card.
I still don't understand why CB DXing is not legal,oh well.
Keep having fun!

Bill,

First of all, I wrote this:

Keep in mind that to raise your signal by
one s-unit you have to increase transmitter
power four times to pull it off!

To which Sharon answered:

Ya know I've tried to tell people that. That anything over 100-150
watts is a waste of time and
energy.

And further more, this is more than theory, it's a matter of
simple physics and mathematics! Just because calibration and
circuit design will not allow analog or digital signal strength
meters to read accurately does not render the above
statement incorrect! A 3 db increase in power output
is realized every time power output is doubled. The fact that
"Most S-meters are wide open at the low end and compressed at
the high end" doesn't change this law of physics, it simply
makes it impossible to see a direct correlation between
actual power output and s-meter readings. (The standard
unit of measurement for the s-unit is 6 db.)

These analog meters can be made to read with a fair
amount of accuracy when properly calibrated with an rf
signal generator!

Jack

Check Sams Photofact or service manuals for generator
calibration voltage and meter reference levels!

Bill,

Note also:

Improper setting or adjustment of the
Automatic Gain Control circuit in radios
similiarly equipped will also destroy the
dynamic range of the receiver as well as
providing inaccurate s meter readings!
The proper adjustment of the AGC assures
that the receivers audio output remains
constant over a wide range of receiver
signal input levels. I have noticed
over many years that most so-called
CB Shops simply run this adjustment
wide open because it results
in what they perceive to be an overall
increase in receiver levels, while at
the same time completely destroying the
dynamic range of the receiver in the process,
the end result being that nearby signals cause
"blasting" and adjacent channel rejection goes
to hell!

Not this morning, on 27.345 AM some evenings we get a lot of skip from
the that part of the world and I have worked much of it on my Cherokee
CBS-1000 barefoot doing 4 watts. I know most of you guys like to run
power, but it is amazing to me what you can do with 4 watts. I have
worked Europe, South America, Canada, and much of the US on 4 watts. It
is a real challenge and accomplishment to do that. Talking skip on 4
watts is one change I wish the FCC would make in the existing rules.
Have a great day! Jon.

Their is usually a back to back set of germaniums in the RX section to blow
to prevent the rest of the RX section from going..

Or, if you have a PIN diode switched set (rare), then you might have those
blown.

Depending on the radio, it could be easier to just replace it.

Hello Glenn: Yes I must agree with you. I stand corrected. I must have rolled your reply in with Gary's.

Maybe I thought the answer should have been more to the pointing to the receivers first RF amp transistor, not just the closest transistor to the antenna.

Dittoing your response, I'd disagree with. Giving a more accurate, more better, and more bittchenerr response, yes I did.

Well, if they were still making them, I'd say go get yourself a Turner
M+3 or JM+3. In my opinion, it is probably the finest preamplified
mobile microphone ever produced. They still pop up for sale (used) from
time to time at hamfests and on Ebay. As far as new mics.....I'd
probably go with one of the astatic models.

The info below is informative but there is a problem still; digital phones transmit digital signals, these signals can be detected but cannot be heard on a scanner (it sounds like hash). They need to be converted back into the analog format to be heard, how can this be done?

pllo2a@aol.com (PLLO2A) wrote:

If you have a Wilson 500 and it doesn't work right, there is the clue
right there that something other than the antenna is wrong. The 500
should work nicely.

"Class" has to do with the biasing of the amplifying devices (either
transistor or tube). If you really want to learn more about
amplifiers, get yourself a copy of "Sam's Radio Handbook" by William I.
Orr (W6SAI). It covers many other topics as well. Class A amps are the
most "Linear", but are inefficient, produce a lot of heat and are cost
prohibitive. Class C.....well, I won't even go there! Class AB offers
the best balance between "linearity" and efficiency and is the class
employed in most "top shelf" Amateur amplifiers today.

"Toll Free" is absolutely correct here. Class has to do with the
biasing of the amplifying devices, not the "configuration".

The original company does not make the antenna any more, in fact I do beleive that the original
company has long passed. There is another company that makes an imitation Sigma 4. Don't remember
the copycat name they put on the antenna though. I saw one when they first came out, and i have to
say "Splined aluminum radiator element?". Ok I guess. AFunny as to haw I listen to the radio but
never hear them brag about the antenna. I have heard a few indivduals off the air talk about how
they though they where a piece of ^%$#, but thats all hears say.

Asdfor MC Turner, I have a couple of questions to ask. Did you modify the antenna? For the fact I
have never seen a Sigma 4 over 28.5 feet long. 32 physical feet is more in the words of 7/8 wave
not 3/4 wavelength. Or did you modify the matching network drastically? or just add 4 feet of
radiating elemet to the antenna?

Ok Tube Guys I need some help.
I have this old Varmint Mobile 190XL that I need help on tuning. I am going to put it in the combine and stay away from houses like advised earlier.
Here it goes, I am not familiar with tubes.
How do I tune/ setup this to my radio ?
On the bottom of the box there is two switches, which way should they be positioned? Also there is an adjustment screw right beside it.
On the front there is a plate knob and a load screw , how do I set these up ?
I know I am being very vague about all this but it is the best I can explain it. I am hoping that someone on here still has one of these or has had and can help me set this up.
As it is getting about harvest season and I do alot of talking in the combine late at night.
Thanks,
tinker

That more then likely sounds like alternator noise, One solution is to stop at radio shack and get the snap on ferrite core, Im not sure how windings it would take but put it on the power leads and the might just help get rid of the whine, even stop it alltogether.

Digital phones transmit digital packets modulated just like a computer
modem. If the packets were encrypted before they were sent, you'll
never decrypt them if they are using a good algorithm. Same thing
happens when you use your web browser on a secure site. The packets
you send to the other site are first encrypted, then sent.

OK, I have a few questions about this amp.

1. Does the bias change on any of the transistors when you depress
the SSB button for SSB delay? I can't see it in the schematic I have
but it might not match those amps exactly.
2. What is the best average dead key power level drive for the amp?
3. What is the best average power drive level fully modulated in AM?
4. What were they thinking when they put the AM button (Green button)

on the amp? Was it possibly a bias mode switch that never materialized?

5. Why is it so easy to experience modulation compression with this
amp? I see it
start around 300 W output power when driven with 2W dead key, using the
front-pannel variable control to set the output power level.

Any help with these questions and any other operation specific info is
greately appreciated.

John

>1. Does the bias change on any of the transistors when you depress
>the SSB button for SSB delay? I can't see it in the schematic I have
>but it might not match those amps exactly.

In the case of all of the 667v's I have owned this will give you the lowest deadkey on the variable and will have the best swing when used with the AM button depressed as well
>2. What is the best average dead key power level drive for the amp?

I use 2 watts. I have found that the 2290 driver works best at that level.

>3. What is the best average power drive level fully modulated in AM?
35 -40 watts max is the highest I would use. I have found that you will burn out the variable pots faster at higher with higher deadkeays and swings. It has a driver it doesn't need to be driven

>4. What were they thinking when they put the AM button (Green button)
>
This is the high/low button. Depressed is the low side. With it in you will typically find your deadkey to be variable from 0-300 watts. With it out dead key is variable up to 500. In addition to AM button in with the ssb button button in on AM you can vary your dead key 0-100
I have had 3 of thes amps now and I could not be happier with an amp. Mine have served me faithfully for years. The latest one is one of the new ones and it out
talks either of my old ones.

I've had some luck with DX on barefoot AM, but I prefer SSB... I love running barefoot stock radios... It is a challenge because of all the noise and QRM from other stations, but I have a lot of patience, and when the time is right, I can work some pretty good DX. I don't even own an amplifier, just a Maco V5/8 on my roof, and a STOCK Cobra 148GTL.
Good day to all, Jeff..

Get used to it, or at least for the next few years. The sunspot cycle is heading for a peak, and before long it will be possible to work most of the world almost 24 hours a day.

It's worth that 5WPM code test and tech written to get on 10 meters.

Toll Free wrote:
>
> I have seen 800 watts out of mine in daily talking for about 5 years.
>
> Would that be reliable?

You're probably fanning the heatsink and keeping the
TX duty cycle below 50% because you know better.
Your next statement supports what I just said.

There are other variables that enter in to it as well.
You know what I'm talking about. What you just said
sounds like something you blurted out before you really
thought about it. You and I don't represent the average
CB amp user. We can't use our personal stuff as an
example. Your 667 in the hands of a guy with a high
antenna SWR that likes noise toys and won't shut up
wouldn't last a month unless you leave the fan(s) on
it, and the lack of supply voltage causes the collector
current to drop back into the safe zone for high duty-
cycle use at a safe zone junction temperature.

> It will also do 1100 or more, but that is for short keys...

By competition standards, 1100 is weak for a 4-pill.
By daily-use standards, 1100 means sure death for a
4-pill. We both know these things and shouldn't be
contradicting each other when there are so many other
people out here that could use our help or REALLY need
to be straightened out.

>
> No it is on a switch.

The better dealers put SSB switches in the 225s that they
sell. At the very least, they will cut the trace next
to the delay capacitor to eliminate the delay for customers
with AM-only radios. All you should have to do is ask.

> > How about the preamp ? Can it be used without the amp
> >turned on ?
>
> Yes it has a pretty good pre amp and it can be used with out the amp being on.

The Blue Face 225s don't have an independant pre-amp.
The XL series Blue Faces do. They also have a SSB switch.

> I saw a couple of replys to this that recommended you drive the amp with a
> modulator. You can do this with the 500 R,but Not with the 500 V (variable).
> You will find that you burn out the variable pots and the amp wont work right.

The "V," when on high (only the red "power" button in),
bypasses the variable pot. When running a modulator, the
amp should be running in the highest power position
where the variable pot is out of the circuit.

3709. Help on Lafayette pse.

Newsgroup: rec.radio.cb
Date: 1999-09-23 00:00:00 UTC
From: Gerry Vorstenbosch <pa3fbl@amsat.org>
Message-ID: <37EAAA3F.C91CFF17@amsat.org>
Source record: 3709

Hello techno freak's,

I'm searching a long time for the services manuals or a
schematic from the CB radio - Lafayette 2400 FM-HP, with
board nr (PCMA 032 A)
On board is a PLL 02a and this CB-Radio is with a high power
amplifier on the back. SSB power up to 50 watts.
Missing on board is Q-50 what is the type of this
transistor, perhaps an 2sa1012 ?

I do have an operation manual witch says, (Printed in Japan)
but if this CB-Radio is also made there, I don't now !
I also have an service manual from an Lafayette 2400 FM
but this is not the same as the Lafayette 2400 FM-HP.
Print type nr; of the Lafayette 2400 FM is PCMA001s
Print type nr; of the Lafayette 2400 FM-HP is PCMA032a
I'm searching for the PCMA032a one.
This Lafayette 2400 FM-HP (PCMA032a) has many SMD components
on board.

Having a problem in the dc switch and can't fixed it without a
services manual. Do you have the services manual from this CB-radio.
Please let me now.

Otherwise can you help me with some info where this CB-radio is made
and some factory addresses as well.
You do me a great favor if you have some info to help me out
with this one.
I cant believe that this print type is used in just one CB-radio
and there is an great possibility that this type of print is also
used in other CB-radio's perhaps you have it.

Many, many, many, thanks in advanced and hope to read some from you.

To make it clear for you,

CB-radio ; Lafayette 2400 FM-HP
Board nr ; PCMA 032 A
On board PLL ; 02A
High power amp ; On the back of CB-Radio
Type of Radio ; 240 channel Mobile 5-Mode Transceiver.

Yeah I started off with a junky Kraco (whatever), and that's lasted like 3 months. I then upgraded to a Messenger 123a, now that was a great radio. It was only 23 channels, but it works for a long enough period of time. My antenna at that time was a cheep rat shack, 5/8 wave, I believe. I then bought 3 Cobra 18'z, and used them a while. Now I um using a Euro 3900. This radio works, but there always room for improvement. Now my antenna is like 60 feet up, and is a dipole, with 3 ground planes off of it. I also am moving to a 3 element beam.

Toll Free wrote:
>
> If you like the Galaxy line, the 88 is about the best.

The 2950 is a better bang-for-the-buck choice that does
everything an 88 does for less except the TX audio effects.
The analog meter on the 88 is better than the bar graph on
the 2950 too. The TX audio effects and the analog meter
can be added to the 2950, but the features that the 2950
offers that aren't on the 88 can't be added to the 88
because the 2950 is CPU (central processing unit) controlled
while the 88 is not. To me, that makes the 2950 a better
choice.

> If you like the legal line of CB radios, then the Uniden 8719 chassis (148,
> Grant, etc.) are the best.

If it weren't for the Midland 79-290 I'd agree.

The 79-290 somehow slipped through the FCC cracks
(that should excite all the legal beagles on the
negwsgroup). The 79-290 has an FCC type-acceptance
number, therefore it's a legal CB. However, it's
a dual-final, high-level, AM modulated radio that
always does more than 4 watts AM (average) and 12
SSB (peak). The coarse clarifier is unlocked in
the stock configuration too. To add 5 extra bands
of frequencies all you have to do is solder jump two
points in the control head--you don't even have to
remove a single screw from the radio itself. The
coarse clarifier is already unlocked, so you'll
have full coverage. Remove Q33, tune one coil,
and adjust a few pots, and the radio will dead-key
2 and swing to 30+ and 35 on SSB at 14.5 volts.
The stability is excellent even when tuned-up.
That means the radio doesn't freak out when running
an amp into a high SWR or a mag-mount. The small
size and modern look will appeal to many people as
well. The price is good too, considering how cheap
the mods are. I'll completely set-up a 79-290 for
$40. Compare that to $90 or more to do a Grant or
a 148. The only thing that bothers people about
the 79-290 is that it needs a continuous power source
or it loses its memory. A number of people have
contacted Midland about that and were told that

it's normal. That can be an annoyance; but, all
things considered, the benefits of the 79-290
DEFINITELY outweigh the drawbacks. I've been in
CB for 20 years--I like the old standards like the
Grant and the 76. But, if I had to buy a new
"standard" CB right now, I'd buy a Midland 79-290.

> I typically see more Bird watts from a Cobra 148 than I do a Galaxy, but the
> Galaxy will do more on SSB clearly.

That's not what I see. Most Galaxies are dual
final radios--that means they naturally make
more power than the single-final standard CBs.
The AM-only Galaxies have audio output transformers.
That means they get the advantage of an autotransfromer
effect which raises their output to more than can be
had using a transistor-based modulator stage such
as is used on the 148. The 148/Grant chassis is
one of the weakest TX performers still in production,
in my opinion. They're the reason why amps like the
667 are still available. The 148/Grant is a throwback
to 20+ years ago when no CB radio made more than 15 to
18 peak watts. In those days even the AM-only radios
that had audio output transformers were weak because
they used such low-power RF driver and final transistors.

Maybe I misunderstood something.

I agree. What's worse is that the amp can't stand
that for very long and will fail. That results in
down time and an expensive repair.

Boy, I didn't know that. I was going to recommend the
2950 or the Lincoln as I know they'll do the entire 10
meter band including the high end where alot of FM repeater
activity is starting to sprout up. Will the Galaxies do
offsets and PL tones? As far as I know, those things are
still the domain of the 2950.

In almost all cases you can go 18 volts when the amp
is unbiased (technically Class C). 18 volts is the
C-E breakdown voltage for most 12 volt RF power
transistors. The amp's stability is much better
when unbiased (running in what's commonly refered to
as Class C). That allows you to get away with higher
supply voltages and AM drive levels. The top of the
transistor design curves are 16 volts; that's where
I would stop with a daily-use amp that might see bias
and/or hasn't been re-resonated for higher voltage use.

I guess that's as close to a compliment as you get. I suppose Toll
should feel blessed.

The problem is that you haven't added ANY leading edge information
to this newsgroup. If I'm wrong, tell me. List the leading edge
info and/or secrets that you've cut loose with since you've been
out here.

It's easy to bitch, criticize, and then list a bunch of callsigns
at the end in an attempt to make your opinions seem more qualified
than the next guy's. It's alot harder to prove that you're anything
more than just another average tech. A picture of you at a cluttered
bench isn't enough.

Toll, this is what I meant when I said "an explanation of the classes
of amplification." I hope you get it.

Toll, some of what you're saying here is wrong.

Dig out your old books and review.

If you keep writing posts like this, you'll force me to jump in and
correct you--I don't want to do that. You, I and a couple of others
are the last of what I call "the old guard." We should be teaching,
not arguing amongst ourselves.

3726. Re: What class is a Silver Eagle 200?

Newsgroup: rec.radio.cb
Date: 1999-09-23 00:00:00 UTC
From: Bill Eitner <kd6tas@netzero.net>
Message-ID: <37EABE8E.F494D0FB@netzero.net>
Source record: 3726

Chris wrote:
>
> I have a Silver Eagle 200 and was wondering what class amp it is?

It has no applied bias.

Since the transistors need .6 DC volts on their bases to
cause collector to emitter current to flow, and that the
.6 volts isn't supplied by an external bias circuit in
your amp, most people will call your amp a Class C amp.
In a semantic sense they're correct. In a realistic
sense, your amp trully operates just on the Class C side
of Class B--which is a LINEAR class. That's why it pro-
duces a useable SSB signal.

Chances are you're confused--that's not abnormal. VERY
few people on this newsgroup really know how to classify
amplifiers. Most who think they know are simply regurgi-
tating things they've heard or read by people they thought
were smart and/or infallible.

3727. Painting an antenna?

Newsgroup: rec.radio.cb
Date: 1999-09-23 00:00:00 UTC
From: "R.J." <rjmcman@nb.net>
Message-ID: <19zG3.137$BE3.459@newsfeed.slurp.net>
Source record: 3727

Just as the subject says is it possible to paint an antenna without any effects? My girlfriend came up with a ripping paint scheme for my new antenna and I was wondering if paints would throw anything askew. I know some colors have different traces of metals in them, would the antenna change after application? Has anyone even tried this or am I the first person with a crazy idea? I would like to hear everyone's opinion.

3728. Re: Confused and wanting to know

Newsgroup: rec.radio.cb

Source record: 3728

Hello ODVTATDL: The reason the Francis Amazer is 96 inches long, and not 102 inches long is, the
energy travels a little bit slower in the fiberglass antenna as compared to the stainless steel
whip. I have talked with the folks at Francis, the 96 inch fiberglass is electrical equivalent to
a 102 inch antenna.

Most antenna type ah guys figure the antenna lengths at 5 % less than what the formulas call for.
So if you use 233.6 and divide it by 27.0, you get 103.8.

The spring will make the antenna longer, resulting in working at a lower frequency.

Jay in the Mojave

3734. Re: sweet sixteen vs. Messenger

Newsgroup: rec.radio.cb
Date: 1999-09-23 00:00:00 UTC
From: Toll Free <tollfree@bigradios.com>
Message-ID: <WhzG3.921$Ph7.2930@insync>
Source record: 3734

The Sweet Sixteen needs a driver.
It is Class AB
It is a clean amplifier.
It will do app. 1400 watts with 100 watts drive at 12 volts (or thereabouts)
It likes app. 30 watt carrier

The Messenger 1200 doesn't need a driver, just a high drive radio (like yours)
It is also Class AB
It is also a clean amplifier
It will do the same 1400 (or so) watts, but with about 30 watts PEP drive
It is not as stable, as the driver stage is in the same case as the box.

I have both a Messenger Competition 1Kw (16 transistor amp) and a Sweet Sixteen. I can typically see more out of my sweet sixteen (after you half the output of the Messenger, as it is twice the amp) with the same drive (halved).

The Messenger is filtered on the output so it is somewhat cleaner spectrally. The Texas Star is not.

I like both the amps. I bought the Messenger from a close friend, or I probably would have bought a Texas Star 3200. The Messenger stuff is good, clean and reliable, but I can get a Texas Star so hot it will fry eggs, parts fall off the PC Board, etc., etc., etc. and they keep on going.

Cleanliness, run in accordance with the instructions -- Messenger
Balls to the wall Class AB output, still kicks ass -- Texas Star.

I also like the idea that I can run my sweet sixteen with no driver, and that makes a damn nice little amp.... 8 Pills at 300 watts output.

Your electric system will handle either of these amps.

Bill,

I retract my statement.

I was going by the current frequency spread, as well as the high end of an old Pluto "H" model.

Had an extra 40 channels in their! ;-0

And you are also right, the Galaxy does not have any of the "goodies" that the microprocessor controlled radios do, like offset.

If all you want to do is talk skip, the Galaxy will serve a person fine, in my opinion.

3736. Re: are tube based amps better than transistor amps?

Newsgroup: rec.radio.cb
Date: 1999-09-23 00:00:00 UTC
From: AB7RS <tglenn@imt.net>
Message-ID: <37EAC9DE.474B@imt.net>
Source record: 3736

Really a matter of opinion,I use both and by far prefer transistorized amps.I hate the tube amp because I have to "tune" it and I am lazy(auto antenna tuner,digital voice unit to send CQ,etc.).If a person only used 1 narrow band this wouldn't be a problem but I would look for an amp with some cheap but rugged tubes like 572Bs.Also many people have died because of the high voltage present in tube amps.
With a good transistorized amp you just key-up and talk,if the SWR is dangerously high or the amp is getting hot,or you are overdriving it the amp will protect itself till you resolve the problem.

Sounds like a good radio. I would like to see one. Maybe when I am in Oakland next weekend, I will stop by and look at it.

You near a BART station? I am going to be on the Ankle Express, but if you are near a BART, I will stop by...

Anyway... I do like the 8719 chassis. I can see 10 watts Bird out of one fairly easily, and rarely see that out of a Galaxy, even when really pumped. The ones that mod a Galaxy for that many watts usually see a lot of them brought back in a month or so. I also like the TX audio that comes from one.

The transformer modulated radios where not in the equation because I was talking SSB only. For AM use, any radio that uses a transformer for the modulator works well.

>
> > I typically see more Bird watts from a Cobra 148 than I do a Galaxy, but
the
> > Galaxy will do more on SSB clearly.

See my statement above.

>
> That's not what I see. Most Galaxies are dual
> final radios--that means they naturally make
> more power than the single-final standard CBs.

Not necessarily! You ever look at the dual final Cybernet chassis? They won't even hit 4 Bird watts! Shitty regulator design.

Galaxy is better, but I never see the even power application from the modulator section from the 148.... Due in a large part to the better voltage regulation of the Galaxy regulator / modulator. However, when a "swing mod" is done to the Galaxy radio, it sounds like shit. Not so with the 148.

> The AM-only Galaxies have audio output transformers.
> That means they get the advantage of an autotransfromer
> effect which raises their output to more than can be
> had using a transistor-based modulator stage such
> as is used on the 148.

I wasn't talking about the AM only chassis. If it was am only, then their are a LOT better transmitters than the 148. For a dual mode radio, I still like it.

The 148/Grant chassis is
> one of the weakest TX performers still in production,

3739. Re: are tube based amps better than transistor amps?

Newsgroup: rec.radio.cb
Date: 1999-09-23 00:00:00 UTC
From: Toll Free <tollfree@bigradios.com>
Message-ID: <zazG3.919$Ph7.2980@insync>
Source record: 3739

The Varmint box is a known splatterbox.

If you don't care about your neighbors, or live in the country, it will serve you well.

Their is close to 300 dollars worth of tubes in it, for 600 watts output. For the same 300.00, you could buy a pair of 3-500Zs that would give you 2Kw PEP all day long, Vs. the 600 watts PEP the Varmint will give you, and with the Varmint you may be buying a new set of tubes in the near future.

If you want to run it at about 400 watts, it will last a good long time... Anywhere near 600 or more, and you will be buying tubes a lot.

They are somewhat cleaner than the class C boxes, as Brewer used a good amount of bias on his, but in the SuperMod mode, they are totally class C.

Hope this helps!

Agreed, and to be safe, I usually stop at 15 volts.

If you measure base voltage / idling current on a typical diode bias amp,
the transistor is WAY on at 15 volts...

Too close for comfort for me, but I have people that do it and have gotten
away with it for years!

From: Robert <a2ir612@freewwweb.com>
Message-ID: <7seh0ulbb1@news.smartworld.net>
Source record: 3741

When used with an Emperor 5010 in the mobile the SWR meter in the radio does strange things. With the amp off the SWR is 1:1 and the power meter reads 9. When the amp is on the SWR jumps to 2.5 and the power meter reads 2. I tried a longer jumper,9 feet(original was 3) and didn't change much. Can anyone tell me what is going on?
By the way, I think it is an older model and shows 15-80 meters on the front.

In my opionion, they aren't the same anymore. In other words,
they suck. That's based on direct experience being an amp
dealer.

> I am seriously thinking of getting a sweet sixteen
> but am also considering the 8 pill Messenger. Anyone have any experience
> for my comparision.

I do. The Texas Star is nearly as stable and MUCH more
powerful. The DX1600 would be my choice. The Messenger
would work, but it doesn't have the gain and therefore
the output of the Texas Star.

> I will put it in my truck, PU, with dual batteries and

That will work.

> My radio is a 2950 and sometimes a 2510. I am not as much interested in
> every last watt as a good clear signal on SSB.

Using only a radio as a driver you won't see every
last watt, but your signal will be incredibly clean.
Personally, I can't think of a better set-up. An
eight transistor amp with a 10 meter monobander as
a driver is a perfect set-up when linearity (accuracy
of amplification) is the goal. The Texas Star 1600
has the most gain of ANY 8 transistor, solid-state
amp including the high-priced Ham amps. In other
words, the Texas Star is a better choice than even
the Ham amps for what you want to do. If your antenna
is properly matched to the amp, on SSB no one will
know you're running an amp. Your signal through the
amp will sound just like it would without an amp in
the line. Isn't that the goal?--I think it is.
Running conservatively, the amp will last a lifetime
too--that's another important thing as far as I'm
concerned.

> Thanks in advance.

You're welcome... I hope this helps.

I don't know if you're qualified to handle this or not, but there's
usually a pair of back-to-back diodes in the front of the receiver
to protect against super strong signals. If one of those shorts
to ground, the receiver will not work. You need to check and
possibly replace one or both of those diodes.

No, but it should. The amp would be more effective
on AM if the driver was a Class C modulator on AM.

> I can't see it in the schematic I have
> but it might not match those amps exactly.

The old 550 schematic is still very close to the
latest generation 667.

> 2. What is the best average dead key power level drive for the amp?

2 watts if maximum output is what you're after.

> 3. What is the best average power drive level fully modulated in AM?

Maximum average with modulation is nearly unlimited.
The secret is to set the dead-key very low.
Considering the driver stage, I'd probably limit
the maximum average drive to 10 watts.

> 4. What were they thinking when they put the AM button (Green button)
>
> on the amp? Was it possibly a bias mode switch that never materialized?

The AM button switches in some input swamping resistance that
really helps to increase the stability of those amps. If you
don't believe me, run the amp with and without the AM button
in and measure the output SWR. It will be much lower when the
AM button is in. That means the amp is more stable.

> 5. Why is it so easy to experience modulation compression with this
> amp? I see it
> start around 300 W output power when driven with 2W dead key, using the
> front-pannel variable control to set the output power level.

Because it's VERY easy to overdrive a one-driving-four amp.
Do you understand what I'm saying? The 500 is a 667 without
the driver stage. Do you know what a driver stage is?

In my opinion, the quality of Pirate amps depend on who you buy them
from and what they know about CB amplifiers. If they know nothing,
the Pirate boxes they sell are likely to be junk. The reason I say
that is I sell Pirate amps and I know alot about solid-state CB amps.
The Pirate amps I sell require work on my part to make them decent as
far as I'm concerned.

The Texas Star DX1600 will outdo the equivalent Messenger. You have
a Texas Star 500; you know that it's a good amp. The 1600 is two
500s put together.

Go with the Star and get a good two transistor with a variable to drive it. Or a TS mod-v with a good swinging radio. You won't ever regret it. The strongest combo I ever saw was a TX800 on low stage driving the sweet sixteen. Radio being used was the Cobra 148fgtldx+ or connex 4800 tuned to 2 watt carrier swinging like 12 watts. Unit really talked local as well as dx with the best of them. The Tx800 is an older unit that on low would key 35 watts and swing to like 200 modulation at 13.8volts. Any amp that will do the same 35-150 drive would be a great choice to drive the star unit.

3753. Re: HAM [SOME] ARE MESSING IT UP FOR CBERS!

Newsgroup: rec.radio.cb
Date: 1999-09-23 00:00:00 UTC
From: Sharon Sherwood <Shardon@ix.netcom.com>
Message-ID: <7scc2j$gp2@dfw-ixnews3.ix.netcom.com>
Source record: 3753

I find it rather funny that ham operators sit on freeband frequencies or ham bands and talk a
world of shit about how dumb people are on those frequencies and then get on the 11M cb band and
act all hollier than though try to preach proper radio operations and when they don't get their
way they no long become part of the solution they become part of the problem. Now this is in my
region where I listen to 26 MHZ to 1.3GHZ. So this is not a generalization of all ham operators.
God forbid some one here might take offense. I may not have a licence but I do have scanners.
Just because you retreat to the frequency that you think is clear there is always an audiance,
remeber that.

Now, the reason some CB'ers, including myself get pissed at ham operators that come down or up
to cb freq. is they take on that "I have a licence, therfore I know more about radios than you
so sut up and listen." Now think about it hams you wouldn't give a lick of respect if someone
started to talk to you like, right?

Example situation:
You come down to 11M and start to play prim and proper, and operate your radio like a ham
station. I have noticed that cb'ers tend to think your trying to sound like your special. People
don't like that. Try just going with the flow of the conversation. Come on If I can sit down at
the flying J and actually have decent conversations with some of the hardest headed truckers.
You can do the same. Don't talk to them like children. Thats what give them the attitude towards
hams.
Now the role reversal. sayyour having a conversation on the ole 2M and someone just got there
ham ticket and starts talking on the 2M band like a cb'ers, lots of hams (not all mind you, but
quite a few) would be lining up to take a whack at brow beating this individual. And I have
heard this happen several times.

Now, for us cb'ers. Though I was going to try to make this post one sided. I think not. The
problem with some of these individuals is that they just don't take it seriously. I don't mean

drill sargent style, but theres no respect toward other individual. The "If I don't know you
within my ring of cb friends you are the outcast, and don't talk on this channel." Thats a
bullshit mantality to go with and you should shut up and listen.

The other problem is secrets, and I mean any body will sit out on the cb and wait for someone to
ask for mods on a radio, and theres some putts just waiting , drooling at the chance to key up
with that information. Just so they can sound like there a technical wiz at moding a cb. Just
because Dr. Crank-ur-radio-up golden screwdirver cb tips and tricks book is at your side dosn't
make you a electronics tech. CAn you read a schematic to actually see what effects that has on
the radios circuitry. NO! I remeber when only a chosen few had amps. and kept it that way so no
over bering fool could act like a ass and try to play cb god. Now, every body has'em and you
need 100 watts just to talk to someone else 1 mile away.

And whats with these power jockey wanna be's that feel they have to key up with 400++ watts of
power at NIGHT, of all times, to talk to a buddie 4 miles away! FOR CHRIST SAKES!!!!! there is a
reason that Broadcast band stations, especially AM stations, reduce there power at night.
Because the FREQUENCY HAS A LOT LESS ATMOSPHERIC NOISE, AND LESS POWER IS NEEDED TO BE HEARD AT
THE SAME DISTANCE!!

Now one more group before I'm done with my rant. SIDEBANDERS AND AM'ERS THE GREAT DIVIDE. The
reason am'ers don't talk alot on SSB is because they cause some select few am'ers cause so much
shit on am and sideband that they are afraid to say there first name. They have spent so much
energy hiding behind a handle and character that they don't want to divulge and personal info
over the air. So you don't hear them up there that often. Now the ssb crowd considers themselves
pretty much as ham operators with out a ticket, And a lot of them are ham's i can sit on a side
band channel and findout what almost everyone on the freq. is running cause they don't hide the
fact that they are running a Kenwood, Yaesu, or Icom. well now you ham operators using that
radio for Illeagal operations. So get of free-banders ar criminals.

The one thing can be said about all bands decent conversation can be had if we try for it.

And to the average joe blow who dosn't know or care to know anything about radios, just thinks
we are whackos that run around with big rods sticking off our cars. And I say ham's,

cb'ers, and
sidebandes, were all sill trash in the publics eye.

Though 75% act like it when they talk on the cb.

>*There are good and bad people in both ham and CB.

Not bad just confused with mis-truths.

>*Illegal power sucks. A "big radio" does not make you a man.

Tell that to the ham that sat on the channel and played musical carriers and spewed slanderous
accuzations towards me for a three months every time I got on the air. Of course i got buddie,
buddie with him, as he was selling off some of his equip. then he was moving and needed money so
I bought his equipment, turned around and sold the equipment right in front of him and still
turned a profit from him, and his old equipment went out of state just like he did. And he was
pissed when i did that.

>*The "Freeband" is not free. If you don't like the law, change it.

Your right and I think the same goes for ham. They don't just get free roam of the spectrum so
stop acting like it.

>It's your right to disagree. But if you are going to disagree,
>at least have the facts.

Your right! And when some one starts calling you names in a discussion, the argument become a
lost cause, because it now has stepped out of a controlled debating form. To a different subject
of try to save face in public.

From: n9wosss@worldnettt.attt.nettt
Message-ID: <37e99187.13689122@netnews.worldnet.att.net>
Source record: 3761

one thing that gits me is people do not understand what litle mening
power has in radio. a half way respectible radio will have at lest
50 to 60 db range from s1 to s9. all most all radios a calibrated to
50mv for a s9 reading or 100mv open circuit with a 50ohm signal
generator. with it reading s9 at that input that means that you can
reduce the input to 0.5 mv for s6 and 5 uv at s3 and 0.05 at s0
sinse ther most rigs have a 0.5uv at 10dbs/n sinsitivity that is why
i stated 50db to 60db becuse thay would have a range of 50 db
if somone was coming in a s9 you should be able to hear him
with 2 20 db attenuators inline if you can't than yor radio is deaf
becuse every person with a respectible cb can hear people
10 to a 100 times a weak as you
if a person is coming in at s9 with 100 watt carrier he can go to
1 watt carrier and still be s6 or go to a 10mw carrier and be s3
and a 1 to.1 mw carrier and still be heard
some cb,s i have tested run about 30 to 40 db from just readable
to s3 and about 15 from s3 to 36 and s6 to s9
if a person came in at s3 with 10 carrier he would nead to go to
300 watts to git to s6 and 10000 to go to s9
some recevers i have tried wer pathetic like some cobra,s
and two whistler,s and a uniden or two or three they ran about
6 to 10 db per every 3 s,units that means that my old realistic navaho
can receiver can hear people 500 times weaker than they can
another thing is coax becuse peaple think they don't nead to run
rg-8u becuse they do not run a kilowatt or more wrong!!!!!!!!!!!!!!!!!!!
rg58 has 2 to 3 db loss per 100 feet closer to 3 that means that half
of the tx power gits to the antenna and half of the rx gits to the radio
and it is collective that means if the each person has 3db loss
than the rx signal will be 1/4 of the no loss level rg8u has 1 db loss
at cb so the same cb,s with rg 8 will have twice the signal giting to
the receiving cb not including connecter loss which varies on coax
used a pl259 with rg58 will have more loss than a pl259 with rg8u
not becuse of impedance bump it is becuse of a velocity and
diamiter bump the p259 was designed for rg8 with the same
dielectric id and center conducter id
the perfict connecter has 0.25db loss with rg8 and 1 to 1.4 with rg58
depending on the instalation job the connecter might have 0.7 to 1db
with rg8 and 1.5 to 2 db with rg58
well actualy it is reflected back to the supply seting up strange standing
waves on the line
the meter is at the point or reflecting and therfor will not indicate any odd
swr readings let alone the fact no one would notice 1/4 to 1/3 of the power
coming back becuse a swr of 2 to 1 means that 50% to 75% is coming back
as for antennas the base loaded antennas are junk most of them have a tuned

dummy load at the base with a wet string for a whip
with a 3 foot whip it is allmost 8% efficint well you ant going to notice that becuse
it will only mean one to two s units with both of you using them when the company
actualy uses a tuned matching unit at the base it might be 25 to 50% efficint but
only on transmit becuse the antenna is still only 8% efficint on receve even less
now becuse on receve it acts like a 400 to 1000 ohm impedance going to a
4 ohm load (ie) the base network is a 50 ohm to 4 ohm setup and in revers
the antenna seas 4 ohm that is a 20 db loss over a 10 db loss for a total of
30db that is half of the 0 to s9 range that is why thay can't hear you but you
can hear them if you have a good antenna like a full 1/4 wave or a
two foot center loaded antenna the two foot antenna is about 25 to 30%
efficint as compared to a half wave dipole with 50ohm fead with no
matching transformer and that is not 25% on tx that is both ways
a quarter wave is about 75% efficent with 50ohm fead

as far as base antennas go a half wave center fead antenna with 75ohm
coax is best with a 1/4 wave ground plane with 50ohm coax and the radials
at a 45 degree angle to breing the fead point to 50 ohms as second best
and next on the line is a jpole antenna fead by 50ohm coax becuse of the
size
a 5/8 th wave and 3/4 have very fragmented lobes most of the antennas
send the signal to space. for people working skip that might be a advantage
becuse the higher the angle the closer the retern bounce that alowes you to
work state side quite well and it still has a ground lobe for the locals and for
long skip (ie) lowe angle of singnal means forther the retern bounce
if i wer you i would stick with the dipole for beter local communication
and if you are one of the people that are determend to work skip
well the dipole is beter for long skip becuse most of the signal is radiated
at lowe angle in the ground lobe
beams have no ground lobe when they are horizontaly polerized but are usefull when
verticaly polerized
the power output is of no meaning when compared to 30 40 and 50 db gans and losses
all it will do is splater someone
harmonics and spers are held to 40db and 50 db down for a reason
lets say you are 10 over s9 on 19 with 50db down spers then on 20
you would cover up somone that is s3 and normaly perficly readable
with that 200 watt peak amp with 5 to 10 db down spers on 19 your still only 20 over s9
and on 20 you will cover up somone that is 5 to 10 over s9
pardin my laguige but
WWWWWWWWWAAAAAAAAAAAATTTTTTTTTT the HELL is wrong with your poor diluted mind that
you can justify a use of a amp

it is ilegal wrong inconsiderit and just plane bad practice and technically dumb

> >Have a great day! Jon.
> >
> >

I agree, I enjoy SSB DX with the legal 12 Watts. I have worked many
parts of Europe, South America, Australia, New Zealand, etc without an
amp. However at times I think 200W would be a nice help. With the
current sunspot cycle you don't need any more than that.

At times I consider getting a ticket but I am currently way too busy.
It would be nice if the FCC would change the rules to allow 11 Meter
DX, since it just naturally happens with legal set ups.

However, I don't get too excited about the FCC with my clean 12 Watts.
Especially with all of the 500+Watt stations, that over modulate and
splatter the whole band. When those guys start getting busted I will
reconsider.

Using a transverter is not the same as a 2510 modded for 2 meters.

I've been advised by most... that the Power Mike is just a toy that makes my broadscast sound "unclean".
By using the dynamike adjustment on the unit, I should have no problem with my modulation.

I'm bagging this idea.

Thanks for the input.

Robert,

That's one of the best descriptions of packet I've seen. The only thing you left out was a discussion of nodes and packet on VHF vs HF.

Regards,

Arnie -
KT4ST

Robert Walling wrote in message <37E94730.14590F3B@wcom.com>...
Packet radio is just a way for two people on computers to communicate with each other using radio to get the data from one computer to the other computer. Most people who use the internet use a "dial-up" connection to pass data. Instead of using a modem and phone lines, packet radio uses a "TNC" instead of a modem, and radio instead of phone lines. One computer user types in something like "Hi, this is Bob in Texas", and the infomation is sent into that person's TNC, where it is converted into a "packet". A packet of information contains the text that is being sent, along with the originating station's callsign, the destination station's callsign, and a CRC which is used for error checking. The TNC waits until the frequency is clear, keys up the radio, then transmits the packet in a burst, then returns the radio to receive. The other station receives the packet burst, and his TNC decodes the packet. The CRC is checked to be sure the packet was received correctly, and if the packet is addressed to him, then the contents of the message is displayed on his computer screen. "Hi, this is Bob in Texas". A TNC and modem are similar, but a TNC can only receive or transmit separately, not tx and rx at the same time like a modem. And the TNC uses error checking. Packet radio and phone patches don't have anything to do with each other.

Richard,

I've been out of CB for a while, but I had a Cobra 50 watt mike back then and seemed to work well. The guys/gals still on CB would probably have a better idea of what's out there now, though.

I've seen articles on how to convert the Cybernet CBs to 10 meters and even 6 meters. But 2 meters would be way too much of a stretch. For one thing, the RF devices would have to be replaced with "VHF" parts. The L/C network combinations would have to all be redesigned. And of course there's that little problem of adding an FM discriminator. VCO injection would take care of the FM TX although it would change in deviation and linearity as you increased in frequency and the VCO voltage changed. Varactor modulation of a fixed mixer crystal would be more stable, but would be more complicated

Sure, it's not impossible, but is it really WORTH it?

Of course, if what you REALLY did, was build a transverter, and use the CB as an exiter, that's really not the same thing.

Agreed. That's the same as stating that my boat will do 80 MPH. While being towed on the trailer. The 2510 is not working on 2 meters.

Transverters DO open up interesting possibilities for HF radios. But don't portray it as a "mod" to the radio. It implies something more than it really is.

A couple of days ago I posted a request for anyone who knows something about the sweet sixteen, texas star, to make some comments regarding a comparison between it and the Messenger with 8 2879's. So far no answer. Maybe my thread got burried too fast, so here goes again.....
Pllllllllleeeeeease... I will drive it with a 2950 or sometimes with a 2510. I am mostly interested in reliability and a good clean signal on SSB. I have dual batteries and a 175 amp alternator in the pickup truck. I have always been willing to spend the necessary money to get something good but want to do this right the first time. I currently have the TS 500v which works good, I just want to step up a little. Thanks again in advance..

I have a Texas Ranger 696F ssb base for sale. It has been modified with extras. This rig has a six digit freq counter, talkback, a 5 tone doorbell added , and an open clarifier. I have all reciepts for this radio. I bought it new 5 months ago and hardly used it. This rig has maybe 10 hours of talktime on it. I am asking 300 dollars with shipping costs included. I spent 350 just for the radio from Copper Electronics. Thank you all for looking at this ad. Email me with interests or questions.

Source record: 3785

Let's set the illegal operator debates aside for a moment and start a new thread. This one is dedicated to all the stupid, foolish, misleading, and downright incorrect statements sellers make during online auctions. All meant in good humor, of course!

The first entry comes from Yahoo! Auctions site: http://auctions.yahoo.com/auction/8946230. This gentleman is selling a 2-meter mobile rig. In the description, he offers the following notice:

"When you bid on the rig, please e-mail me w/ your callsign so that I can verify you are a ham. It is illegal to sell a ham radio to someone who is not licensed. "

Nope. Guess again. Better go back to your Gordon West books.

Note: this address does not accept unsolicited e-mail. Please contain all discussion regarding USENET posts to the appropriate newsgroup thread.

3786. KNY2VS Operations Center website updated

Newsgroup: rec.radio.cb

Source record: 3786
Cross-posted to: rec.radio.shortwave,rec.radio.scanner,rec.radio.cb,alt.radio.scanner

I've just finished updating my website at
http://www.buffnet.net/~kny2vs/welcome.html

The main page above has been updated slightly. The News Page has been updated and some slight changes made to the amateur radio and HF Monitoring pages.

I've also added a "KNY2VS Reviews..." page where I will present reviews of various radio equipment. For the time being, there is only a review of the MFJ-1020B Active Antenna there, but I will add more reviews as I write them.

The Amateur Radio page in particular will be the subject of another, much more extensive update in the near future as I continue working on my modest contribution to the world wide wait...er, web. :-)

They are playing games with numbers. If this number represents
anything then it goes something like this:

12 dbi = (3.85 dbd antenna) + (2.14 db, for the dbi to dbd conversion)
+ (6db for a theoretical maximum ground reflection)

6+2.15 +3.85 = 12db

Your points here and in the previous post are valid, but they don't address the issue: real world performance. My point was that wattage increases that are far less than what's required to produce a 3 dB or 6 dB increase very often produce useful performance improvements. The old rule of having to produce a 3, 6 or 10 dB improvement (which-ever suited the author's fancy) otherwise the proposed change isn't worth the effort is a myth. You can use physics and mathmatics to support a counterpoint, but again, you'll be using oranges in a debate about apples. If you have any practical experience operating a CB station, you know I'm right.

> I do not mean this as a smart ass question.

It's simple; voltmeter-based wattmeters don't agree with
classic equations. My explanation is based on practical
experience with certain pieces of test equipment rather
than physics and mathmatics. That's why twice I qualified
my statements with "using a Bird." Rather than say it
all again here, if you'd like a lesson in practical power
measurement, read the AM Tutorial on my website. There's
a link to it below.

You and Jack are where I was a couple of years ago. You
think CBers don't know what they're talking about because
their answers and explanations don't agree with the
simple equations that have been tattooed on your brains.
I used to think just like you. I know better now. There
have been some very sharp, pragmatic people that have
come and gone since I've been participating in the news-
group. They spent alot of their free time setting people
like us straight. Unfortunately, these never-ending,
petty, repetative debates grew weary and caused them to
stop participating. The flow of high-minded yet ignorant
people to this newsgroup is never-ending--it suffocates
those who are trully wise in matters of practical radio.

The 2510 has to be "modified"
to work with the transverter!
I suggest you look the word up
in a dictionary! Providing the
required signals for mixing to
produce the frequencies required
for 2 meter operation involves
quite a bit of "modification"!

Jack

Dave wrote: (responses in brackets are mine)

But 2 meters would be way too much of a stretch. For one
thing, the RF devices would have to be replaced with "VHF" parts. The
L/C network combinations would have to all be redesigned. (all of this
is provided by the transverter) And of course there's that little
problem of adding an FM discriminator. VCO injection would take care of
the FM TX although it would change in deviation and linearity as you
increased in frequency and the VCO voltage changed.
Varactor modulation of a fixed mixer crystal would be more stable, but
would be more complicated. (all of this already exists in the 2510)

Sure, it's not impossible, but is it really WORTH it?

Of course, if what you REALLY did, was build a transverter, and use the
CB as an exiter, that's really not the same thing.

The "CB" as you put it does not play the role of "exciter"
as much as it plays the role of main oscillator and mixer
in the case of the transverter. The term exciter is applicable
to the extent that the tank circuit for the 2 meter transmitter
is wholly contained in the transverter itself, lending to the
use of this terminology in this particuliar case. The transverter
simply provides the necessary mixing signals to facilitate
operation in the 2 meter band. And no, using a transverter
is not the same as completely tearing down the 2510 and
converting it to 2 meter operation. The major advantage
of using a transverter is that the 2510 still remains usable
on 10, 11 and 12 meters (or whatever) as well! Also, if you
remember, the 2510 already has all of the necessary FM
components required such as the discriminator, vco injection
for FM TX, etc. . There is no need to duplicate any of these
circuits in the transverter itself!

Spend less and have more or spend more and have less.....
I'll opt for the former every time!

Dave,

Let me use your own analogy!

Dave wrote:

Agreed. That's the same as stating that my boat will do 80 MPH. While
being towed on the trailer. The 2510 is not working on 2 meters.

Travelling in the boat on water at 80 mph is much more fun
than travelling in the vehicle towing the boat at 80 mph!

Wouldn't it also be more fun to spend less time, work and
money to have a rig which operated on the 10, 11, 12, and
2 meter bands than to have a rig that now only operates on
the 2 meter band only? Just some common sense! No, the
2510 is not working on 2 meters unless it operates in
conjunction with the transverter, but....It still operates
on all the other bands as well........The choice is yours!

Ok, I am fairly new to C.B. radio, but I have a mobil set up, I got a francis amazer, or as the local radio shop called it, a 102 whip, First why is a 96" whip called a 102", second of all just about all the books I have read say a 9 foot antenna is needed for a 1/4 wave antenna, this would make sence because the formula for homebrewing an antenna (the 234 divided by freq) works out to 9 feet. why not just sell 9 foot whips?? Also I tried it with a 3" spring and got a higher swr than without it. This is buggin the helloutuvme!

I've stood on the side and watched this pile of dog shit get larger and larger. It's quite evident that Robert Schroeder, CB-KING, or whatever his name is; is a agitator. Maybe not at first, but he is one now. At first I think he had such a hard on for CB it became a obsession for him. Nobody on the group would take him in(so to speak) so he took to agitating.

This happens quite often with new guys in my area. They try to get involved with our CB club; but they cuss on the air, key over other members, broadcast music, don't ask for breakes ect... When we quit talking to them they start agitating. The exact same thing happend with this posting thread.

Okay, but when you consider the 88 and the 2950, the
2950 should come out on top.

>
> You near a BART station?

Nope. BART stops in the East bay; I'm in the West Bay.

> I am going to be on the Ankle Express, but if you
> are near a BART, I will stop by...

I wouldn't mind meeting you, but I don't know anything
about BART. Personally, I don't own a 79-290 either.
I'm still using my 2950 and backup President Jackson.
We'd have to go to a shop to see the 79-290.

> Anyway... I do like the 8719 chassis. I can see 10 watts Bird out of one
> fairly easily, and rarely see that out of a Galaxy, even when really pumped.

I never look for average wattage figures. Galaxies
always beat Grants/148s when it comes to peak power
on my bench. However, I've never seen 10 average
watts out of any single-final radio--even the AM-only

units.

> The ones that mod a Galaxy for that many watts usually see a lot of them
> brought back in a month or so. I also like the TX audio that comes from
> one.

I agree there. The TX audio from a Grant/148 looks alot
like the audio from a 76/29; it sounds louder and punchier
than a 2950 or a dual final Galaxy. However, I've never
compared it to a 79-290. What I've focused on is how nice
the 79-290 is on SSB. I take it for granted that the 79-290
will sound at least as good as a 2950 since its a high-level
AM modulated radio. That's good enough for me.

> The transformer modulated radios where not in the equation because I was
> talking SSB only. For AM use, any radio that uses a transformer for the
> modulator works well.

I agree; I just wanted to cover all bases.

> > more power than the single-final standard CBs.
>
> Not necessarily! You ever look at the dual final Cybernet chassis? They
> won't even hit 4 Bird watts! Shitty regulator design.

Like I said, I look for peak power. Galaxies and
Superstars (Cybernet copies) always beat Grants/148s
in peak power. If they do that with a reasonable
waveform, it's guaranteed that the average power
will be at least comperable.

One of our discrepancies here is that I don't see
the Bird as being the last word in performance.
In the field or on the battleground you don't
have much choice. There, the Bird in CW
mode is the last word other than actual competition.
On a good test bench that isn't the case. Like
Dennis, I find that average (aka Bird) wattages
can be skewed by alot of factors. When a wattmeter
is all you've got, I recommend going with maximum
peak wattage rather than average wattage as a measure
of which is the more powerful unit.

> Galaxy is better, but I never see the even power application from the

> voltage regulation of the Galaxy regulator / modulator. However, when a
> "swing mod" is done to the Galaxy radio, it sounds like shit. Not so with
> the 148.

We'd have to talk about this via e-mail as it doesn't
make sense to me. It sounds like you're trying to
baffle me with bullshit. The modulator stages are
of the same design in the Galaxies as in the 148s.
The only difference is that the active parts of the
Galaxies have to deal with twice as much power so
they're heavier.

> The 148/Grant chassis is

>
> Guess we see things different. Both mentally, and on the meter. ;-0

I don't know what you mean by "mentally." Sounds
like more baffle with bullshit antics. The 8719
chassis has a good sound but weak numbers--it's
that simple. Anything else is bullshit--and you
know it. 18 peak watts is typical from a tuned-up
148. Any model Galaxy that was that weak wouldn't
stay in production for more than a couple of years.

Depends on the user. Overall, yes... For a moronic user, no. My grandfather owns a 2900 RCI, and although it is a great radio, he much prefers the ease of use of the Galaxy radios.... Can't stand to use the VFO. This may be a moot point, since the 2950 has a "CB" mode, but still is confusing to some operators.

It is a case by case basis, but on the upper end, you would be right.

> > Bill, I don't do this everyday. This is a new chassis to me, although I
> > have heard that the RX section sucks.
>
> I don't agree--especially when compared to the 2950.

Like I said.. I have yet to see the Midland...

The RCI was pretty easy to outdo in the RX section, though. Galaxy chassis seem to be a little better tuned, but a "Channel Guard" type filter, or another XTAL filter in line does help them, too.

But, if I had to buy a new
> > > "standard" CB right now, I'd buy a Midland 79-290.
> >

I have to take your word for it.

>
> > I would like to see one.
>
> You will eventually.

Maybe. I don't do this for a living, and I don't see much that isn't dealing with competitions, so if the radio won't work well in a comp mobile, I don't see it. I deal with either tube or strictly amateur equip. on the base side....

I would be interested to see what the computer section of the radio did with a linear of some power behind it. That is what I base the computer controlled radios against... Because that is what is the biggest affect that my operating standards have.. The Microprocessors have a hard time with high RF field strength.

Too bad. Although if I get the position out their, I will be living in the area! Guess that would make a meeting a little more accessible.

>

For an AM chassis, that is all I look at. For SSB, it is completely useless. That is what the 4314 Bird is for.... Or the 43 with a PEP kit.

Galaxies
> always beat Grants/148s when it comes to peak power
> on my bench.

Mine, too. Typically a Galaxy stock will outtalk a 148 on SSB even when the 148 is peaked. They don't like to do more than 18 - 20 watts PEP, whereas the Galaxy will outdo that stock.

Hats off to Galaxy for a good SSB transmitter.

However, I've never seen 10 average
> watts out of any single-final radio--even the AM-only
> units.

I can see 8 out of most any of the 8719 chassis. The Cobra 140 / Washington was the easier TX section to get bigger numbers. The double conversion RX chassis where a little tougher. I never digged deep enough to find out why, but that was my findings.

>

And on AM, that punch is usually what gets you heard. You forget, I operate AM usually.... SSB is a sideline hobby.

However, I've never
> compared it to a 79-290. What I've focused on is how nice
> the 79-290 is on SSB. I take it for granted that the 79-290

Then we really are looking at this from the same perspective... I look at the AM transmitter. On SSB the Galaxy is a better choice, if you are mainly an SSB operator. If most of my talking was basic AM, I would opt for the Grant / 148 chassis, and I have. The 88 is sitting in a box behind me, and the 148 is in my Suburban!

>

> > > more power than the single-final standard CBs.

Sean and Dennis went through this about a year ago. The higher AVG figures usually do tend to carry the AM signal farther, but the higher PEP figures do tend to make the SSB travel farther (as it should).

Granted, I can see 8 or 9 watts of carrier out of a Galaxy, but the needle won't move when modulated, or you see a slight flicker backwards. What would you rather see..... 9 watts, swinging to 6, or 3 watts swinging to 8?

> >
> > Not necessarily! You ever look at the dual final Cybernet chassis?
They
> > won't even hit 4 Bird watts! Shitty regulator design.
>
> Like I said, I look for peak power.

Their is our difference. I use the Bird, and although PEP on the Bird is available, I don't always use it. It is nice to be able to see the total

picture, but if you are swinging backwards, and another station is going forwards, the forward swinging station will be heard, all other things being equal! The negative going power in the backward swinging radio will not carry quite as far as one that swings forward.

Galaxies and
> Superstars (Cybernet copies) always beat Grants/148s
> in peak power.

Cybernet sucks all the way around.

Sorry, but that is my opinion as one that owned a shop. Cybernet had the highest failure rate of any chassis at the time (now I would say that Maxon carries that honor). Because of that, I stay with tried and true designs. After all, what has worked for 20+ years must have something right!

If they do that with a reasonable
> waveform, it's guaranteed that the average power
> will be at least comperable.

Not necessarily!

I know that the 4CX250 tube will do 12Kw PEP, rated power. Pulsed.

The AVG output power is only 300 watts at that level.

My Pride DX-300 does 900 watts PEP.

It does the same 300 watts RMS.

Big difference, and the same holds true for the radio chassis. Although the Galaxy doesn't use pulse power, it does not have the AM punch that the AM only and 8719 chassis do!

>
> One of our discrepancies here is that I don't see
> the Bird as being the last word in performance.

I do, because that is the only people that I cater to. They don't care what another "standard" says, as long as I can quote them a Bird reading, they are happy!

> In the field or on the battleground you don't
> have much choice. There, the Bird in CW
> mode is the last word other than actual competition.

And usually, the Bird will tell you the same thing that the competition will, all other things being equal!

> On a good test bench that isn't the case.

Your right. On a bench, with a peak reading meter, the Galaxy will blow most any other chassis out of the water. I agree on that. However, I don't do the majority of my broadcasting into my dummy load....

Like
> Dennis, I find that average (aka Bird) wattages
> can be skewed by alot of factors.

As can any other wattmeter on the market!

When a wattmeter
> is all you've got, I recommend going with maximum
> peak wattage rather than average wattage as a measure
> of which is the more powerful unit.

Actual competition will tell you different! That is where you and I differ. I deal with competition on (almost) a daily basis.... That is what I purchase my radio for...

That, and to give local information to any trucker that needs it! ;-0

>
> > Galaxy is better, but I never see the even power application from the

> The only difference is that the active parts of the
> Galaxies have to deal with twice as much power so
> they're heavier.

And gain figures on the modulator transistor is different, the biasing is different. I will say that for the average radio, the Galaxy has a better modulator. Set your carrier, and that is the number you see on the Bird. It has a lot tighter regulator (modulator) section.

Doesn't change the fact that you can take a 148 down to a half watt carrier, and let it swing wildly from their, and it is completely understandable.

Do that with a Galaxy! Makes the chassis damn near non-understandable! I know. I have to set these radios up for competition use, and I don't run GARGANTUAN carriers!

> >
> > Guess we see things different. Both mentally, and on the meter. ;-0
>
> I don't know what you mean by "mentally."

What do I mean... I mean that I like seeing higher avg power, you like higher PEP. I like the old chassis, you like the new.

Nothing wrong with either of us, because we use our radios for different purposes. For your applications, I agree, the Galaxy (RCI) chassis is

better.

For the AM use, and occasional SSB, the 148 chassis is a better radio. It is time proven, works well at any carrier level, sounds good at any carrier level and lasts even after it has been abused all day long.

You can't say the same thing about a Galaxy!

On SSB, though, the Galaxy will eat a 148 for lunch!

Sounds
> like more baffle with bullshit antics.

No, not at all.

The 8719
> chassis has a good sound but weak numbers--it's
> that simple.

That is what an amplifier is built for. Numbers. If you have garbage going in, garbage goes out.

Anything else is bullshit--and you
> know it. 18 peak watts is typical from a tuned-up
> 148.

Yes, but the avg numbers are a lot higher than an equivelant "other brand".

Any model Galaxy that was that weak wouldn't
> stay in production for more than a couple of years.

Your right again! But, those are radios that have a purpose. Just like the 148s.

You can get an equivelant 148 radio with a Galaxy faceplate for nearly the same price... No freq counter, etc.... If the 148 was such an outdated piece of shit, wouldn't word be out by now about it? I mean... Why do they still make it?

That's not necessarily out of the ordinary. When you turn an
amp on the radio sees the input of the amp rather than the
antenna. Not all amps have flat input circuits. In other
words, not all amps present a perfect impedance to the radio.

> I
> tried a longer jumper,9 feet(original was 3) and didn't change much. Can
> anyone tell me what is going on?

See above. You shouldn't expect the amplifier's input
circuit to be a perfect, non-reactive, 50 ohm load because
that's rarely the case. What's going on is that the amp
is presenting something other than a purely resistive 50
ohm load to the radio.

> By the way, I think it is an older model and shows 15-80 meters on the
> front.

Personally, I wouldn't worry about it. The rule is still
the same: don't worry about SWR unless it's above 3:1.
The only way to correct it is to rework the amp's input
circuit. Most people, including CB shop techs, are not
able or qualified to do that. You might try switching
amongst the different output power positions to see if one
presents a much better match (lower SWR) to the radio
than the others. That, very often, does occur. One
notch down from wide open (maximum) is usually a good
overall setting.

Another worthwhile test is to test the SWR between the
amp and the antenna. Problems there can often translate
into problems on the input side.

Their was a Lead Field Officer in the San Diego office named "Mike".

His handle was Three Legged Snail.

I sold him his first radio.... A Midland Precision Series SSB for a hundred bucks.

I also sold him his first 10Kw amplifier.... A 4 tube 4-1000Z amp.

Nice guy.

He just retired from the "Commission" and talks skip on 6, albeit with a new handle.

The Francis antenna has a copper wire down the middle, the whip is made of stainless steel. Copper conducts better than stainless, therefor the resonant frequency length is achieved with a shorter piece of copper than it does out of stainless steel, it other words copper has less resistance than stainless, therefor it moves electricity faster than stainless, if the antenna was made out of gold or platinum it would be even shorter.

A "moronic" point is exactly what it is. The 2950 in the CB
mode is EASIER to run than a CB because it outlines the RC ("A")
channels. In other posts I've said that the 2950 can be inti-
midating, but that's only until the owner reads the owners
manual or has a helpful dealer go through it with him.

> It is a case by case basis, but on the upper end, you would be right.

Okay.

> > > Bill, I don't do this everyday. This is a new chassis to me, although I

> The RCI was pretty easy to outdo in the RX section, though. Galaxy chassis
> seem to be a little better tuned, but a "Channel Guard" type filter, or
> another XTAL filter in line does help them, too.

The thing to remember is that the 2950 is still as
sensitive as any other--it's just not as selective (quiet).
In other words, it's not like you're going to hear things
on other radios that you won't hear on a 2950. The
difference is that there's more hiss noise in with the
signal when received on a 2950.

I use a 2950 as my base/bench radio. Not long ago I
got tired of hearing the bullshit and conducted my own
test to see just how bad the 2950 receiver was. I had
a 138XLR on my bench. Many on this newgroup think that
chassis has one of the best receivers ever made.
Personally, I don't agree. The UPd 858 chassis that
includes the 139 is a single conversion receiver with
a fancy filter. I've done all the common receiver mods
to my 2950. Both the 139 and my 2950 were in peak tune.
The 139 was quieter, but there were weak signals that I
just plain couldn't hear (I couldn't make out the words
the person was saying) on the 139 that I could (I could
hear the words) on my 2950. I don't like how noisy the
2950 receiver is. They could've used some FETs and
quieted it down; but, in my opinion, it's no less
sensitive than the coveted late 858 chassis.

Then take some time to go play with one.
It's not a perfect radio in every way, but
it's a great radio for the money. It's like
taking the PC-122 to the next level.

> I would be interested to see what the computer section of the radio did with

I only have experience with them up to the 500
watt PEP level. At that level the radio doesn't
even know anything unusual is going on.

Across the bay is only 20 road miles. If you're
really there I'll show up. On the other hand,
the same goes for you. Once you get a car, come
see me. Seeing my shop may be of more value to
you than seeing my face.

I'd put up a dual final radio against a 148 and win
every time in a competition even though I didn't
sound as loud.

> However, I've never

> the 148 is in my Suburban!

Given what you've said, we aren't looking at this from
the same perspective. In my view it takes an AM-only
standard to beat a dual-final in competition. In other
words, my 2950 won't sound as punchy but it'll beat
your 148 every time.

> do tend to make the SSB travel farther (as it should).

I don't know what that means. Real dual final radios show higher
average AND peak numbers. I never heard Sean or Dennis say a 148
carried higher AM average wattages than a dual final radio. For
me to believe that you'll have to pull up a quote. My personal
experience says no to that--what else can I go with? I remember
Sean saying his personal mobile radio was a 2950--not a 148--even
though he could have anything he wanted. Logic tells me that if
a 148 was better than a 2950 that's what Sean would be using.

> Granted, I can see 8 or 9 watts of carrier out of a Galaxy, but the needle
> won't move when modulated, or you see a slight flicker backwards. What
> would you rather see..... 9 watts, swinging to 6, or 3 watts swinging to 8?

Given your conditions, there's very little difference.
Both will hold steady at 6. Like you've seen, my 2950
will hold an 8 watt carrier on a Bird. On a 148 the
needle would swing back to 6 and a half. I'm not a dummy.
I've been at this for 20 years. I know what 148s and 2950s
do. A perfectly well-tuned 2950 won't backswing even when
forced to hold a 10 watt dead-key assuming it's DC supply
is adequate. NO 148 could ever hold a 10 watt dead-key
without backswinging on a Bird.

> > >

> forwards, the forward swinging station will be heard, all other things being
> equal!

How do you ever know when that's happening? And who's
to say that's really the truth? I can just as easily say
that the station with higher peak power is the one being
heard. Today, modulator kits are everywhere. They skew
the classic, average Bird assumtion. Dennis tried to
teach us that long ago. I accepted it--you obviously
haven't. Peak power readings are the only truth left
to us--get used to it.

> Galaxies and
> > Superstars (Cybernet copies) always beat Grants/148s
> > in peak power.
>

> Cybernet sucks all the way around.

That's a biased, personal opinion based on nothing
of substance.

> Sorry, but that is my opinion as one that owned a shop.

Again, so what?

> Cybernet had the
> highest failure rate of any chassis at the time (now I would say that Maxon
> carries that honor).

Not in the old days. Only when the copies became
prevalent. Think about it. Midlands, road talkers,
and Penney's radios were and are every bit as good
as their uniden counterparts.

> Because of that, I stay with tried and true designs.
> After all, what has worked for 20+ years must have something right!

That's bullshit. Uniden survived--that doesn't
make their stuff better by proxy. If Cybernet
evolved like Uniden evolved, who's to say Cybernet
wouldn't be better?

Personally, I think alot of the "export" designs
are as much Cybernet copies as they are Uniden
copies. Look at the trace paths on the left
side of the solder side of the board on all
Superstars and Galaxies as well as their
new copies like Northstar. The board design
looks much more like a Cybernet than a Uniden
design. At the very least, somebody is stealing
the old Cybernet board layouts. What's to say
they aren't stealing the circuit designs as well?

You need to look at this objectively.

> If they do that with a reasonable
> > waveform, it's guaranteed that the average power
> > will be at least comperable.
>
> Not necessarily!

Yes, necessarily.

> I know that the 4CX250 tube will do 12Kw PEP, rated power. Pulsed.

Pulsed power is bullshit when compared to CB.

> Big difference, and the same holds true for the radio chassis. Although the
> Galaxy doesn't use pulse power, it does not have the AM punch that the AM
> only and 8719 chassis do!

That's crap. If that were the case they (Galaxy) wouldn't
be sucessful. The majority of bucks-up CBers use Galaxy
radios because they're known performers.

The first thing you need to straighten out is the output
out of that DX3. It should hold that 300 watt carrier and
then some resulting in a much higher peak value.

> >
> > One of our discrepancies here is that I don't see

>
> Your right. On a bench, with a peak reading meter, the Galaxy will blow
> most any other chassis out of the water. I agree on that. However, I don't
> do the majority of my broadcasting into my dummy load....

What difference does it make? A dummy load makes
other factors become equal. You should like that.
I have to say that sustainable peak rules.

> Like
> > Dennis, I find that average (aka Bird) wattages
> > can be skewed by alot of factors.
>
> As can any other wattmeter on the market!

You're using a Bird--we KNOW that thing can go
all over the place--at least admit that. Average
Bird readings are even a bigger joke.

> When a wattmeter

If my 2950 were to beat your 148, what would you say then?
I trully believe that would be the case. If you intend to
live here and talk like a big shot, we'll have to clash.

What makes that "mental?" You're talking meter readings.

I want to get along with you, but you can't bully me. Maybe
you should call me when you get close.

> Nothing wrong with either of us, because we use our radios for different
> purposes. For your applications, I agree, the Galaxy (RCI) chassis is
> better.

It's a little late in the game for that.

> For the AM use, and occasional SSB, the 148 chassis is a better radio. It
> is time proven, works well at any carrier level, sounds good at any carrier
> level and lasts even after it has been abused all day long.

That's simply crap.

> You can't say the same thing about a Galaxy!

Yes I can, and I already have. My 2950 will
support a 10 watt carrier at 14.5 volts.
Show me the nearly stock 148 that will do that.

> On SSB, though, the Galaxy will eat a 148 for lunch!

The 2950/Galaxies will eat 148s in any mode--
that's what they're made to do and that's why
they're popular.

> Sounds
> > like more baffle with bullshit antics.
>
> No, not at all.

I believe you're being genuine, but your
arguments don't work.

> The 8719
> > chassis has a good sound but weak numbers--it's
> > that simple.
>
> That is what an amplifier is built for. Numbers. If you have garbage going
> in, garbage goes out.

That's true to a point, but we're not talking
about amps--we're talking about radios.

If you want to talk amps, I really believe
in the straight 4-pill design. I believe
the straight 4 to be the most popular design
in production today because of how the radios

work. The straight 4s are a perfect match to
the 30-35 watt PEP radios that are very popular
today. That doesn't include the weak-ass 148.

> Anything else is bullshit--and you
> > know it. 18 peak watts is typical from a tuned-up
> > 148.
>
> Yes, but the avg numbers are a lot higher than an equivelant "other brand".

Using a sinusoidal waveform, 18 peak watts
means the underlying carrier was no more
than 6 watts. That also holds true for
average Bird watts.

> Any model Galaxy that was that weak wouldn't
> > stay in production for more than a couple of years.
>
> Your right again! But, those are radios that have a purpose. Just like the
> 148s.
>
> You can get an equivelant 148 radio with a Galaxy faceplate for nearly the
> same price... No freq counter, etc.... If the 148 was such an outdated
> piece of shit, wouldn't word be out by now about it? I mean... Why do they
> still make it?

The word is out on it. I had one that was fully modified
and it took me 6 months to sell it because they're just
not as popular as they used to be. It was a sound-tracker
too. People know that they're weak compared to today's
radios. They just don't want them anymore.

That's unlimited.

> 2. How much farther can you communicate? (obviously the other party
> would also need to be similarly equiped).

If you really go nuts (more than 2000 peak watts with a
decent antenna), people will hear you that you can't hear.
That represents a badge of honor in a dumb useless way to
dumb useless people.

In a basic stupid way, the goal is to be able to talk to
anyone you can hear. That usually takes 500 peak watts
at least. These are all estimates with no guarantees.

> 3. What kind of investment in $$$ would a decent unit run (entry
> level, but decent?

I'm assuming you already have a suitable radio and
antenna. If so, you're only looking at the amp.
Given that, I would start at the 500 peak watt level.
You're talking at least $300 to go to that level. To
get it installed and working, you're looking at another
$100. So, let's talk $400 to $500 to get something
decent going at least. This assumes you've already
had little amps like the Blue Face 225 and you want
more. If not, the 225 will help and can be made to
work for $100 or so.

> 4. Am I correct in assuming that you simply hook the unit to a 12 volt
> power source; connect it to an antenna and you're set to go or is it
> more complicated?

At the 500 peak watt (4-pill) level, that's correct.
However, there are some simple system improvements
that will net you noticeable increases. Tuning your
radio makes a difference that's worth doing.

> 5. Any other things one might need to know?

Yes, but they should be between you and your dealer.
In other words, getting personal with your equipment
dealer is a good thing. If the dealer you choose is
impersonal, you should move on and not look back.

The answer should be "yes." The risk of confiscation
and fine is so small that you should worry about it as
much as you worry about slipping in the shower of dying
while crossing the street.

Anything you can turn down makes a good driver.
The 500V isn't a "fantastic" driver because it's
not unbiased and it can't be set to run at the
same carrier level as the radio.

3820. Theoretical Antenna Height

Newsgroup: rec.radio.cb
Date: 1999-09-23 00:00:00 UTC
From: Andrew Taylor <drewtay@bellsouth.net>
Message-ID: <37EB2BE3.56B64406@bellsouth.net>
Source record: 3820

Just a theoretical question? Not far from my home is an old radio tower (approximately 200 ft) that is no longer used.
If by chance I could install an antenna on top of it with nobody knowing, run coax down and just have it waiting for me to pull up with my mud-ducking mobile. Would that increase my ability to transmit?

Message-ID: <7ZKG3.28182$I6.424371@typ12.nn.bcandid.com>
Source record: 3822

Andrew this is "Line of Sight" problem. At 11 meters the formula for determining the line of sight for a radiowave (in miles) is "1.4 x the Square Root of the Height". This is of course is not taking into account ones individual topographic conditions and assumes we all live on a flat, smooth sphere.

An example would be; If you had a house that was 20' high and then added 15' of antenna mast connected to an antenna, the "line of sight" for this radiowave would be 1.4 X the square of 35, which = 8.3 Miles

Using your 200' tower the calculation would be: 1.4 X the square of 200, which = 19.8 miles.

Using the tower is a 240% gain in "Line of Sight", and even your Mud duck mobile will transmit further than you ever beleived it would by using the structure. Just make sure that if you do it, that you purchase the thickest affordable coax you can find because 200' of coax, plus the coax run going over to the radio, is one hell of a run for 5 watts. And, do yourself a favor, make sure the antenna system is grounded if you operate the radio on days of not so nice weather conditions. (PS: Dont climb an old tower unless you rope it off with safety guys every 30' or so up the tower because the welded joints in most old tower are the first thing to let go. Its not worth it)

It is Great to reach out and make that contact on legal power. I have a President Lincoln and a Texas Star DX400 and a Wilson 5000 and never turn on the amp and always have the Lincoln turned down to try to get the contacts. I have the power for those hard times when the Megawatts stations get in there and have absolutely nothing to say but normally get smoked but who cares. When i flip the dial and hear bleedover from three channells over I just keep a turning to get away from the mess.

I just bought a 29 WX NW ST and the radio works great. Have a President Lincoln in the Ford pick up and can't get rid of RFI from the motor but when i hooked up the Cobra there was no noise and no decrease in incoming signal. Maybe the Lincoln is tits up but is brand new. Ford just stinks with there shielding i guess.

>Please, tell me what the net result of all your "RFEnforcer"
>efforts have been to date. My guess is ZERO.

This is correct. I am not an agent of the Federal Communications Commission and therefore have no authority to conduct enforcement efforts and levy penalties against offenders. I simply keep my eyes and ears open for signs of illegal activities and pass the information on to the proper authorities (kind of like a "neighborhood watch" for unlawful radio operations.) I can do nothing to impede your efforts nor can I change your behavior.

However, I believe it's just a matter of time before someone who does have enforcement authority takes an interest in your activities. Stick your nose out far enough and someone will bite it off. You have to admit, it's not very wise to openly admit to selling amplifiers to unlicensed individuals on a public newsgroup and then purposely attatch your name and amateur callsign to your postings.

Keep doing it. You'll eventually catch the attention of somebody "important" who can do something about your activities.

HI,
I am interested in a linear amplifier and have some questions. I'll just jump into them and hope someone can assist me:
1. How much power increase in transmitting is gained?
2. How much farther can you communicate? (obviously the other party would also need to be similarly equiped).
3. What kind of investment in $$$ would a decent unit run (entry level, but decent?
4. Am I correct in assuming that you simply hook the unit to a 12 volt power source; connect it to an antenna and you're set to go or is it more complicated?
5. Any other things one might need to know?
Thanks a lot,
Ray

3843. Who sells/builds mobile "hump" mounts?

Newsgroup: rec.radio.cb
Date: 1999-09-24 00:00:00 UTC
From: rfenforcer@aol.com
Message-ID: <19990924003809.09319.00000319@ngol02.aol.com>
Source record: 3843

Does ANYONE make a mounting bracket for multiple radios that will fit over the transmission hump?

What I am envisioning is a metal "rack-type" mounting apparatus where 3 or 4 radios could be "stacked" vertically and mounted in the area between dash and seats. A strong, sturdy mount that would attatch permanently via sheet metal screws to the car floor above the transmission...completely covering the "hump." Something like this would provide a neat, custom installation for all my equipment.

Come to think of it, what do the cops use to mount their multiple radios? Since I drive an early 90s Mercury Grand Marquis (dimensionally equivalent to a Ford Crown Victoria), I'm thinking whatever works for them would work for me as well.

Who sells and/or custom-builds these things?

If you could do something like this you would want to use very good quality
coax or you may lose more than you gain.

Please be advised that using a linear amplifier on CB is illegal and carries substantial penalties if caught. If despite this warning you decide to run one anyway, at least be considerate of others and use a clean amp.. Class "C" amps *DO NOT* fall into this category.

As far as which is better Tube v/s Transistor, it depends on what you are looking for in an amp.. If you're looking for an amp to run mobile, solid state is the only way to go. Comparing "apples to apples" (base amplifiers with built in power supplies): Tube amps are offered at higher outputs and are generally less expensive than solid state amps with an identical output level (high power amplifiers 1kw+, the price difference diminishes as you step down to lower power amplifiers). However, tube amps have to be tuned when you change frequencies, and the tubes will eventually have to be replaced (no tube lasts forever). In particular, stay away from amplifiers that use T.V. sweep tubes. With the exception of the Svetlana EL-509, these tubes are no longer being manufactured and are getting more expensive every year as NOS tubes are depleated. If the amplifier doesn't run tubes designed for RF amplification ie: 811A, 572B, 3-500Z etc. etc. don't buy it!

Solid state amplifiers don't have to be tuned, are generally quieter (those that don't use a blower for cooling), and the output devices will generally last indefinately (as long as all operating parameters are kept within the manufacturer's specified operating tolerances). Heat is the transistor's enemy. If the amplifier is properly equipped with sufficiently sized heatsinks, is properly driven and loaded (no high VSWRs please) you should enjoy years of trouble free use from a solid state amplifier.

Hope this helps.

If you want a nice small tube base amp with low cost tubes go wth the Ameritron 811H(800watts).This is a nice small amp and is available at any ham outlet or on any swap page.With this amp you will need a small driver(100 watts). 1200.....

I tend to agree. Before you buy a "Sweep Tube" box, check out an 811 box.
The tubes are around $20.00 and can triple the rated output of a 6lf6.

The 2950 does PL tones? Since when? I know mine doesn't. All mine has is a stupid roger beep. It does do splits quite nicely though.

The Uniden HR-2600 DOES do PL tones and repeater splits, which was its advantage (for a 10 meter FM ham) over the 2510. For the Cber, the 2510 was a better choice.

FWIW, I've never seen a galaxy radio that I really liked. Most of them sound crappy on SSB, especially after they've been "done up" by Joe screwdriver. Their frequency drifts, the built-in counter generates hash noise on some models, and I've seen some that the final stage self oscillates. Not the kind of radio that I would own......

I still like the 2510 as the 10 meter radio of choice, and the Uniden 8719 chassis for "legal" CB, although that Midland model sounds very interesting.......

I have no arguement with what you've done, and agree with what you say, and applaude your creativity. My only "bone of contention" is saying that you "modded" a 2510 to work on 2 meters. It's a misleading statement, which implies that you somehow made THE RIG into a 2 meter radio, which is not true. Yes, you might have had to "mod" the rig to work with your transverter, but it's not really the same thing as making the entire radio into a 2 meter radio. It's no different than someone saying that they "modded" their Cobra 29 to put out 500 watts, which oh-by-the-way, is because they added a 500 watt amp after the radio.

>
> Spend less and have more or spend more and have less.......
> I'll opt for the former every time!

Ok, but there isn't much magic to using a transverter. I've used one for 6 meters for years. The main things that you need to deal with are attenuating power output, down to the level used for mixing within the transverter, T/R switching, and level matching the receive drive.

A properly designed transverter should require NO modification to the "drive" rig, as it uses 10 meters (or whatever) as its "I.F.", and all signal "conditioning" are done within the transverter itself.

Some drawbacks are that there are cases when strong 10 meter signals will "leak" into your radio overtop of the 2 meter downconverted signals. This can be partially compensated for by using a high grade shielded cable, and making sure all connections are "tight". Other problems are that the "quality" of the drive radio is not as good as a well designed 2 meter all-mode. My 2510 is a good radio for what it is, but the FM audio quality (receive and transmit)is not as good as my 2 meter all-mode. The 2510 uses a carrier squelch, which can be annoying on FM, as noise pulses can break the squelch. A simple noise squelch circuit can help in this area, and is one "mod" that I recommend for anyone doing serious FM work with a 2510.

But hey, it's a cheap way to get on 2m SSB! Good luck with the setup!

> $100. So, let's talk $400 to $500 to get something

Why on earth would it cost 100.00 to get just an amp installed? Lets assume you strart from scratch on the amp install. Here is what you will need.
1. 15 ft of four gauge welding cable(the best thing you can use for a 4 pill and up) with battery terminals on each end. 20.00 max
2. 2 wire nuts suitable for 4 guage wire. 1.99 here locally at scottys
3. one 3-6 ft jumper 7.95
this comes to a grand total of around 33.00 with tax if you buy the stuff retail. just about anyone out here can give you detailed instrutions on how to set it up and install the amp yourself. It is a fairly straight forward job and really is pretty easy to do.

I want to thank everyone who responded to my thread. As a result of your input, here is what I am going to do. I'll get the Texas Star, 1600 with the factory fan kit, mounted behind the back seat of the truck. I will use the 2950 (at least at first) with my TS 500V mounted under it in the drivers compartment. The 500V should be OK as a driver if it is turned down very low. To use the setup, I could 1) transmitt with the radio barefoot. 2) transmitt with the radio and 500V only. 3) transmitt with the radio driving the 1600. 4) transmitt with the radio, 500V and 1600 all on.

Seems to me with these choices, the set up should do just about anything I would want out of a mobile and still sound great.

One of the reasons I was hestitating to use a driver is most of them appear to be Class C and that would detract from SSB quality. Naturally, as most of you probably do, I use SSB around town, (a large metropolitian area) to shoot skip, and AM while on the road.

The last think I am querious about is if while using the radio into the 1600 without the driver, will the 1600 relays kick on and stay on with just the radio as imput? I guess I'll find out.

Last, are there any units built specifically as drivers that are Class AB? I would be pretty unhappy if I accidentially had the TS500 turned up high and turned the 1600 on at the same time.

Thanks to everyone again. You are a big help.

I have a few comments about the WDc Break. It may have been a huge success for the Club, they worked hard on certain details but left many to be desired. Specially where the "real money maker" for the club is in the keydown Contest. Rules were handed out and If I am not mistaken rules were posted on the web for some time before the break. Upon arrival Friday night I was told even before all of the competitors were even there to have there say as well, the decision to not allow the Tall antennas in any of the sky classes was already rendered. Not allowed, I guess the people who said no to this didn't just put out there hard earned cash and time investing in a set of the antennas with the full intention they were to be allowed in the sky classes. The people who said No to this came to the break knowing full well they were to be used at the break in the sky classes. Hmmm maybe they were afraid to lose with there big bad mobiles to a guy with 1/2 the watts. I know of 5 people who came a long way to key in the sky classes but now it was the old bait and switch tell them one thing to get them there when they get here tell them another. Next point of business, the AC 1 Alt Class was to be no more than 3 alternators, this rule has been in effect at WDC's for 2 years and was fully known before the break. After the competitors paid an entry fee, a meeting of sorts was held on the field, the people running more than 3 alternators wanted to get in the class, again this is nothing new to this break always was 3 or less Yet the Club changed the rules completely saying there would be no class if not more than 3 people stayed in to my recollection 2 guys were running 3 alternators and they were basically forced To key, so now it was 4 alternators perhaps even more I didn't see anyone check each other in the AC 1 Alt Class. To make matters a little worse the person who won AC1 also Won AC multi without making any changes to his mobile, kinda makes you think he was running multi alternators from the start. Was he confident, he sure was he threw $1,000 on the ground wanting to bet the guys who only had 3 alternators? Great Job Gang, Now the best is yet to come, No one had any idea where the station was except one competitor, yes that's right the guy who won all the classes he keyed after finding the target, he was allowed to pull his mobile onto the field after the contest had started and find the target, No one else had this opportunity to do this, you may have put a blindfold on and Spin around and point where ever you wanted to. Someone tell me where this was fair. Also this gentleman was running 5 antennas do you think this may have helped him lock onto the target. People were told the Watergate would key up before the contest and a chance to find it for everyone. Nope this did not happen either. Now a lot of people spent there hard earned money to enter what they thought would be a fair key, they came to the break expecting the club to hold up its end by sticking by the rules, what sense are rules if you don't follow them. Now if I had won close to $2,000 like the person who was able to lock onto the station and who was allowed to take full control I may be a happy camper today. Instead I feel like telling everyone dont go to this break next year or in 2 years. They tell you one thing and do another. Everyone wants a fair and equal shot at winning

at a keydown. When the playing field is changed from what you were told it would be this is not fair at all, and deserves to be made public. If exceptions are to be made to those who cry the loudest who wants to give clubs there money. I would rather stay home and tell others to do the same, instead of giving a donation.

well the head is shocked, you mean there is a lack of fairness at a keydown. well what do you expect??????? this is sop for this type of activity and has been for years. sounds to me like the fix was in and it was a political thing, but whatever.....you are lucky to be able to leave with your radio equipment still working and intact. blow this meaningless behavior off and just talk on your radio and enjoy it. leave this mundane activity to those who think it is important.,,,,,,,,,,,,,,,,,,,,,,,,head out and standing by.....

A swing kit will not increase your wattage. All a swing kit does is lowers your carrier down to allow you more forward swing. The only advantage to this is you will have a good clean signal significant gains in your audio. You are correct it will indeed void your warranty. Putting a swing kit in a radio will not hurt you at all but be careful some of them out there are garbage. Remember to do one thing when you get it installed. You have to go auuuu auuuuuuuuuu auuuuuuuuudio...

I got the got that same letter.It was sent from RFWATTS whom ever he may be?This is my responce to RFWATTS. I would like to respond to the negative publicity that the Shootout and the Watergate City CB-er's are receiving due to a gutless want-to-be technician, that has no balls. He came to debut his new boxes. I think he should change the name to "Soft Touch" because they did not bust a grape. This tech has not been competing in competitions that long, so he is still a little wet behind the ears. My advice to him is to stop crying and get his nose out of his ole technician ass and go to work on his mobile. As far as the ï¿½ wave antennas are concerned, stop trying. This is a mobile shootout. What's the difference between letting you run them, than a man with a 100 ft. crank up tower and a beam on his mobile? TRULY SPEAKING 4 ALL TO HEAR..... WDCBREAK .....

Adding a swing kit will do nothing to increase your signal strength. All swing kits do is make the output meter on the transmitter and signal strength meter on the receiver swing wildly with modulation which seems to be a big deal among a lot of cbers.

Roger that. Class C for AM on the 2290 driver would have been a good mod for this amp.

>
> > I can't see it in the schematic I have

> 2 watts if maximum output is what you're after.

That is what I am using now with the "swing mod" that is documented in the RCI Bible. I don't see much swing on the power meter with the amp on even though the
RCI 2950 I am driving it with goes from 2 to 6-7W with modulation. I see 200W dead key and only a nudge up from there with modulation. I can change the variable
resistor down to get more swing but the ultimate power out with modulation doesn't really improve. It is still around 180 to 200W on the meter. I have put it on my scope and setup the radio and amp and got close to 400 W (estimated) but the peaks were distorted and I sounded bad. I guess you can't get blood out of a rock. I probably should have gotten the 550, oh well.

>

> The secret is to set the dead-key very low.
> Considering the driver stage, I'd probably limit

> the maximum average drive to 10 watts.

I am going to try that next. Just a simple change to the "swing" mod :-)
I'll get it to swing from 2 to 10 and see how I sound.

>

>

Well, on the subject of SWR I feel I am getting to be nearly an expert :-) My
first 667V had an SWR nearly 2.3:1. As it turned out, it was the first order
harmonic that was causing the high SWR. I did everything I could think of
first before discovering it was the harmonics. A low pass filter fixed the
problem and now I am 1.1:1 on 27,185MHZ using a tri-mount mag mount and a
Super Penetrator antenna. But before adding the filter I grounded the frame
of the mag mount to the chassis and changed the coax to 95% shielded, 80%
velocity factor RG8? coax. Anyway, I read more books on SWR and propagation
in general. That was the fun part.

> the driver stage. Do you know what a driver stage is?

Oh yeah, I even have a spec sheet on the 2SC2290. I was trying to figure out
how best to bias it and drive it. If I get time over the next few months I
may experiment with that AM button and see if I can use it to switch the
driver stage to Class C for AM. It should be fairly simple to bias that
transistor at cutoff but I first have to reverse engineer the amp to
confirm/update the schematic I have. I want to know where I am starting from.

Thanks again, later.

Beg to differ.
They will not only increase your audio, they will work much better with a
linear.
There are a couple of sites on the net that discuss this very subject. I'm
sorry I don't have the addresses handy but they're easy enough to find. Make
sure you get good instructions if you do the work yourself. It's not a
super-difficult job, but if you have any doubts, go to a qualified tech and
have it done for you. I suggest arming yourself with whatever inf. you can
before you do either. Bottom line is know what you want before you ask for
it.

Good luck

Well, actually there are 2 towers there. As far as neighbors, you must first understand that I live in a rural area and the nearest neighbor of even highway is a good mile or better. These towers are in an old pasture that backs up to my land so access would be easy. Even eaiser is that the guy who owns the land used to lease that spot to a radio station years ago and hs has no problems with me being there. I guess the towers are just left overs.

Being a construction worker by trade and accustomed to working at various heights. Climbing and putting up an atenna would not be the problem, paying for the coxial would.

The whole point was I was just curious what would happen transmitting a barefoot mobile from there would accomplish.

Hello Andrew: You bet it would. During the late 60's and 70's the group I ran around with had a 5/8 wavelength ground plane, up against a mountain, mounted on a old mining tower that was still pretty sturdy, and about 50 to 60 feet high. You would drive up this old dirt road a few hundred feet, part next to the tower and BOOM-BA instant get out big time.

The PL-259 connector was used a lot, you could tell of the wear on the outer ring, we weren't the only ones using the mountain mounted Base CB Antenna.

If I was you, I'd have a professional climb it and use new good coax like LMR 400, RG213, or 9913F. Yeah! Use a MaCo V58 or Penetrator 500.

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the road ah ways from the fillin station.

Source record: 3898

It depends on what they are calling a swing kit.There are many modifications
you can do to the Cobra 29 to increase its output..both wattage and
modulation....You`ll get a lot of negative feed back from some of these guys
and I think its just the name "swing kit" that sets them off..I guess there is
someone who mass markets a group of components under that name which do nothing
But any GOOD tech will make modifications to a radio to increase its out
put..Hell I know of 35 different mods for the Cobra 29...Don`t forget to up
grade the final
As for your warranty.that only covers manufacturing and material defects
any way...And that covers almost nothing that ever goes wrong with them

I hope I did`nt brain my damage.

3899. newbie question Uniden / PC122XL or Grant XL

Newsgroup: rec.radio.cb

From: Viffer <viffer@itis.com>
Message-ID: <7sgren$1ti$1@news.chorus.net>
Source record: 3899

I'd like to start by saying I'm a newbie here and don't want to step on anybody's feet. I have been using my dad's old rig in my car, an old Midland 23 channel with a new K40 antenna. The radio works great but fits poorly into my car (a dodge neon with minimum underdash area. I want to upgrade to a sideband radio with 40 channels. I have narrowed my choice down to the Uniden PC122XL. I would like to get the extra features of the Grant for just a little boost in price but the larger radio just will not fit into my car without hacking away a lot of plastic while the PC122XL will fit nicely into the spot formally cradling the ashtray. My question is threefold. Is this radio good enough for a newbie in sideband? Am I really stupid for going for it over the Grant? or are there other radios out there that are both small and feature packed while still being a good buy? Any comments good or bad on these radios would be welcome.

First, the people who came and where not allowed to run the tall antennas should have withdrawn and not competed. They have to give you your money back.

The people that entered AC 1 alternator should have taken their money back.

If rules where handed out, and then they are changed, it is your right to say "No, I think that I want my $$$ back, or put the rules back in effect".

The problem here is that th entrants put up with it. If you take the $$$ and run, the club will feel the dent in the pocketbook and learn.

They tried to do this in Memphis, and all the AC Sky competitors said that they would not key.

Since the Sky people are the ones that draw the crowd, and they are the ones that people enjoy watching, they are the ones that when they pull out, they make a difference.

Screwed situation, but that is the way it is.

The PC-122 is a stroker, if you get the correct person to work it over.

It will not channel as easy as the Grant, but can be made to go 40 up and 40 down, with a kit.

It is a good radio, overall, and I think you will be pleased.

It is called the Sky class, right?

That means that it is Sky is the limit, or no rules.

The rest of the classes should be run as mobile contests...

The Sky classes have no rules. That is the way it has always been, and the definition of "Sky is the limit" means anything goes.

I also find it very hard to believe that you would allow someone running 3 alternators to compete in a 1 alternator class without pulling a belt off.

You wouldn't do that in the south! Maybe that is why the boys from DC don't come to the south?

Not trying to knock you, or your club, but this person, even if he makes a soft box, couldn't win if he runs tubes in a DC class, is right.

> 1. 15 ft of four gauge welding cable(the best thing you can use for a 4 pill
> and up) with battery terminals on each end. 20.00 max

Multiply that times two, so you can also run the ground to the battery or alternator. So, that is $40.00

> 2. 2 wire nuts suitable for 4 guage wire. 1.99 here locally at scottys

Wire nuts cause voltage drop under load. Use a junction block ($10.00 here in Houston), and the 4 connectors you will need for the wire, compression type are generally about 4 dollars a piece... This takes it up to $26.00

> 3. one 3-6 ft jumper 7.95

Agreed. 7.95

> this comes to a grand total of around 33.00 with tax if you buy the stuff
> retail. just about anyone out here can give you detailed instrutions on how to
> set it up and install the amp yourself. It is a fairly straight forward job
> and really is pretty easy to do.

Looks like if you do the math, and do a proper install instead of using "wire nuts", you are looking more like 60 dollars in parts (rounded off). Drop another 35.00 in labor (not everyone wants to run the cables themselves), and you are....

Hey, right at the hundred dollar level!

Guess what.

Bill was right.

Your wrong.

He was describing a commercial installation.

You where describing a half assed homebrew install.

They would probably both work, and they <<might>> both work well...

But, why take the chance on an amplifier that will cost someone another hundred dollars to fix <<if>> it goes bad. Have it installed by the shop, and if it is bad from an installation point, you are covered.

Another thing you didn't include in the equation was the grommets to go in the firewall, those would run another 3 dollars, and the fuse block to put in the positive lead, that is another 10 to 30.00, depending on what you use, and the fuse for a 500 watt amplifier would vary from a couple dollars to 10 dollars, once again, depending on the fuse block installed.

3913. Re: Painting an antenna?

Newsgroup: rec.radio.cb
Date: 1999-09-24 00:00:00 UTC
From: Jay <jay123a@qnet.com>
Message-ID: <37EBECCE.EB6C267@qnet.com>
Source record: 3913

Hello "R.J.": More that likely the paint will not effect the antennas performance. But you didn't tell us what type antenna it is, base or mobile, or model or make.

All the bad news from painting antennas comes from painting a fiberglass antenna with a also solid metal type paint. This will effect the antennas performance. However paints that are made for being a paint on metal type material are very expensive. Most other paints well work. A lot of horror stories come from military maintenance personnel painting a fiberglass radome with a heavy metal based paint, many times, causing the antennas performance to be degraded. You will see a lot microwave or radar frequency type antennas that have the antenna surface already painted, with a warning saying "DO NOT PAINT THIS SURFACE"

But CB frequencies are a million miles away from the microwave or radar frequencies, so there will be some forgiveness should a metal based paint be used on a CB antenna.

You can experiment around by using PVC pipe as a over the antenna as a radome. Get a S-meter reading from a station a few miles away, then put the PVC pipe over the antenna, and measure any loss in field strength from another station a few miles away. Then paint the PVC pipe and again get a field strength, or S-meter reading from the same station a few miles away.
I'll bet you won't see any difference.

Then you should take a picture, and let us see what it looks like.

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the road ah ways from the fillin station.

On SSB you wouldn't.

Most of the discussions in this area of late assume
AM as the mode of operation. On AM, it's popular
to set-up at least one driver stage to run unbiased
so it can act as a modulator (increase the energy
contained in the sidebands to a greater degree than
the energy contained in the carrier).

When it comes to covering all of the 10 meter
band and having CPU generated features--yes
I prefer the 2950. For over 10 years it's
been the best value in CB/10 meter radios.

> AM
> only a 76 will out talk any of those junk radio's and last a hell of alot
> longer.

You didn't read the whole post. AM isn't all
there is to CB/10 meters. The 76 is a simple
radio with an audio output transformer instead
of a transistor based modulator--those are the
reasons for it ruggedness and performance. On
the other hand, it's a simpleton's radio that
quickly becomes boring if you're into anything
other than competition or banging heads with
the AM idiots.

> 2950's fall apart and short out in most truck setups.

There's a million of them in service. Less
than 1 percent have problems, but closed-minded
people only remember the bad stories they've heard.

> Good for a base
> unit but not year round in a car or truck.

See above.

> Galaxies sounds good but have alot of
> RX problems and poor solder joints.SSB go with a Grant xl /148.Sean Told
> everybody out here a while back the 76 put up the best numbers.

Sean runs a 2950 in his car. Only in competition
do you need the "best numbers." And look at Sean;
he doesn't even have time to get out here anymore
because he's busting his ass honoring the unrealistic
warranty he put on all the radios he tuned up in the
past. He's far from being all-knowing.

> Go to a keydown
> and see what people use for radio's. That will give you an idea of the radio's
> that give the best peak watts and audio.Hint: not to many 2950's or
> galaxie's.1200.....```!```

AM and competition isn't all there is to CB.
You're narrow minded.

Enjoy your 76 since you're so anal that you'll never
be able to enjoy anything else.

Exactly. Many of the laws today weren't made by the
people. Of course you wanna-be cop types can't see
past the simple definitions of legal and illegal to
see that many "crimes" are victimless and that the
related laws are just plain stupid.

> Used to be, people had respect for the law.

Used to be, laws made sense.

I can make pointless generalizations too.

> Now, anything's fair game as long
> as "I probably won't get caught."

That's the way it's always been. The difference
these days is that nearly everything has a law
attached to it, and that there's an ever-growing
group of goofballs like you that have nothing
better to do than point fingers.

> Just another example of our rapidly-eroding
> moral standards and general state of society in America today.

Yea, right--get a life.

Absolutely not.

A swing kit doesn't get you anything that simple tuning
mods won't get you except a lighter wallet.

> I seem to be getting out fine within 2 to 3 miles. Cobra says it
> will void my warranty. Has anyone out there had experience with adding more
> wattage via swing kits?

Swing kits don't get you any wattage that a simple tune-up
wouldn't get you.

A simple tune-up will make that radio work as well
if not better than it would with a swing kit. If
you're mechanically inclined at all, you can do the
tune-up yourself. It involves removing 2 parts--that's
it. Here it is: Remove D11 and the slug from L14.
It's no big deal.

A tune-up makes you sound louder, but it really doesn't
give you alot more range. Adding an amplifier is a
better solution if alot more range is what you're after.
A more efficient antenna would help too.

> Just want to tell it the
> way it is .

It's only the way it is in your mind.

I've owned six 2950s since I learned of them in '88.
I've only had to repair 1 of them. The others
were sold to people that liked my sound. I still
use one and back it up with a President Jackson
just in case all the horrible and frequent failures
begin. That hasn't happened yet.

> I live in the northeast and the 2950's don't stay together up
> here.Between the cold winters and bumps in the roads the 2950 goes south real
> quick.

Maybe you've just been unlucky or you're going by
other people's horror stories. The main board
design in a 2950 is basically the same as in the
old export Uniden Grant--which isn't a helluva
lot different than a standard Grant. The CPU
section can be sensitive, but they've improved
that over time too. The latest generation
(serial numbers above 440000) are alot less
parts dense than the earlier ones. That adds
up to greater reliability.

I just don't have a problem with them. It takes
all kinds out here. There is no one, unarguable
truth out here. Thinking there is will just
lead to arguments.

> If you want channels the hr 2510 last longer(uniden).

I had a Lincoln when I discovered the 2950.
I couldn't get rid of the Lincoln quick enough.
I think the 2510 and it's clones are crude
radios. They especially suck when it comes to
AM modulation.

> By the way i run a
> uniden GRANT XL and a nice Washington with most of advantages of the exports
> ,which will out live your fine 2950.

In your opinion.

Grants and Washingtons are 20+ year old designs
that are barely any more advanced than the 76.

Simple radios for simple people.

> Take care Bill. Just my two cents .

73.

3939. 4 pin connector / Uniden

Newsgroup: rec.radio.cb
Date: 1999-09-24 00:00:00 UTC
From: Daniel Kazinski <Treecare@Execpc.com>
Message-ID: <37ec3996$0$10185@news.execpc.com>
Source record: 3939

Does anyone know the correct soldering sequence for the 4 pin connector microphone (astatic) that will be attached to a Uniden CB. I need to know what color wires go to what pins. Its been a while.....well quite a while since I did my last one...

Thanks in advance !
Dan

Yes, their is.

The baseplate is nearly 10 inches in diameter, so it holds up a multi-pound antenna well.

The quick disconnect is made of Brass plumbing fittings and custom shaft pieces to accomodate the large diameter antennas so you don't end up stripping them out or flexing the bottom of your antenna.

They are built for the big antennas prevelant today. I like them, and Troy guarantees everything he sells.

Be prepared to drop 50 or so dollars on one, though.... I have owned other mounts, and one destroyed my antennas. If Troys mount does that, he buys you an antenna.

Yeah, OK.

How are you going to hear my on the bowl (and quite a lot of people on the newsgroup have, and I have talked to them) when you never listen..

You have said in the past that you don't listen to the bowl, and would NEVER operate their.

Seems to me that you are an agitator, and an asshole.

But, we tolerate you. ;-0

Toll,
As I remember it, there were a few "hearing" problems with the judges at Memphis last year that should be fixed this year or it might be the last year for Memphis holding a decent break.

3947. Radio stuff for sale: Basement cleanout

Newsgroup: rec.radio.cb
Date: 1999-09-24 00:00:00 UTC
From: Wildcat <wildcat@tp.net>
Message-ID: <uJ8H3.30789$I6.684339@typ12.nn.bcandid.com>
Source record: 3947
Cross-posted to: rec.radio.cb,rec.radio.swap

All equipment in working order unless noted:

1 HR-2510 10,11 and 12 meter radio with Chipswitch and Channel Guard installed. Comes with radio and Chipswitch manuals, Turner +2 Handheld preamp mic, stock mic and mounting bracket.
$200 buyer pays shipping.

1 HR-2510 10 and 11 meter radio with stock mic, Astatic preamp mic (never tested, condition unknown) and mounting bracket. Recently tuned and peaked. The radio has 2 small holes in the top cover where a frequency counter was installed $150 buyers pays shipping.

1 Johnson Challenger 6-80 meter Transmitter with tubes and Johnson Model 122 VFO. Faceplate of radio looks great however the case needs painting. This radio was working when originally boxed. $150 buyer pays shipping.

1 Johnson Transceiver Tester. Comes with original box and Manual. Has Modulation, SWR, RF signal strength, Crystal tester, Audio and Signal generator. 5' Telescoping antenna. $50 buyer pays shipping

1 Yaesu FT-840 HF AM, FM, SSB and CW Tranceiver. Has MARS/CAP mod. Excellent condition. Comes with Stock mic, manuals and original box. 1 owner. Has CW, AM and FM filter boards installed. $495 buyer pays shipping.

2 Cobra HX-35WX 40 Channel CB Walkie Talkies with Weather channels and Accessory Telescoping antennas along with the "Rubber Duck" antennas. 1 owner. I bought these to use these on camping trips. Have boxes and manuals. $60 buyer pays shipping.

1 Yaesu FT-901DM HF AM, FM, SSB and CW Tranceiver in mint condition with FTV-250 2 meter transverter, SP-901P External Speaker/Phone patch and Stock handheld mic. Transverter still has plastic "shrink wrap" on the faceplate. Have all original boxes and Manuals. $495 buyer pays shipping.

1 MFJ-1278 Multi-mode TNC Faceplate is fine but case paint is chipped off in a couple of spots. Have original box and manual. $50 buyer pays shipping.

1 KDK FM-2015R 2 meter mobile with stock mic. Looks and works great. Have original box and manual. $75 buyer pays shipping.

1 Astatic Stock D-104. Condition unknown. $25 buyer pays shipping.

1 Preamp Astatic Silver Eagle Mic. I bought it used but I never used it. Has 3 position switch on the bottom base for "ETS", "PAD", and "VOX". $50 buyer pays shipping.

1 Shure 526-T preamp mic. Works fine. Presently wired for a Yaesu FT-840 (above). Have manual. $40 buyer pays shipping.

1 Micronda (Radio Shack) SWR/Field Strength meter. No small field strength antenna on top. $12 buyer pays shipping.

1 CD-44 "Ham II" style Rotor and Controller with Compass position readout. Its been packed for some time so the condition is unknown. Cosmetically good. Have manual. $130 buyer pays shipping.

1 P-103 Military Dynamotor. Can produce up to 500 volts @ .16ma with 6 or 12 volt input. Originally used in Military aircraft for radio and electronic amplifiers. I bought it to run an 807 or 811 bottle in a mobile application for nostalgia purposes. Very heavy unit. $50 buyer pays shipping.

1 Homebrew 10 meter tube crystal transmitter with a Hiesing 120v power transformer in it. Unknown condition. $20. Buyer pays shipping

Below are some "Off topic" items for sale:

1 1970 Ford Torino "GT" Convertible with a 300hp 351ci Cleveland. 4bbl carb. Automatic. Black on Black on Black with original Ford "GT" side racing stripes. Body is in good shape. Needs new paint, top, and certain interior items. Strong original motor with 85K ORIGINAL miles on it (does not blow oil). Completely stock. $4200 Can provide *.bmp pictures via email.

1 Gibson Les Paul "The Paul" guitar with case. Natural finish. I bought it in the mid 1970's. Low action with no buzzing. Has Lawrence "Twin Rail" pickups. Ebony fretboard. $400 buyer pays shipping.

1 1977 MGB Convertible project car. All body work professionally done and the car is completely in primer. Entire car must be re-assembled. $4800 invested and I dont have time to finish. Make reasonable offer (Wife is torturing me to get it out of the garage and I cant hold her off any longer).

1 1967 Camaro SS/RS Convertible in next to Mint condition. Only 950 manufactured. 51K ORIGINAL miles. White paint with Orange racing hood stripes. White top, White Interior and Black rugs/dash. Hi-perf 327ci w/Ramheads. Quadrajet 4bbl and Muncie Stone Crusher 4 speed. 3:73 12 bolt posi rear. Has Factory GM Air shocks with GM auto fill compressor in trunk which is controlled from the dashboard. This car is show quality. All original. Have original window sticker, manual and the "Red-line" spare tire has never been used. Can provide *.bmp photos via email. $25,000.

Correct. Also important to note that the opposite is NOT true. A poor, cheap antenna cannot make any radio perform well. Thus, a Cobra 19 Plus with a Wilson 1000 will outperform a 148-F with a Popular Mechanics mag mount from Wal-Mart.

If you're on a limited budget, put your money into the antenna first.

3956. Re: Loudest Radio

Newsgroup: rec.radio.cb
Date: 1999-09-27 00:00:00 UTC
From: Jack Thurston <fire228@cybertrails.com>
Message-ID: <37EFA2F6.4649@cybertrails.com>
Source record: 3956

Bill,

"A strong carrier with a low percent
of modulation may give a weaker response
in a receiver than a weaker carrier with
a greater percent of modulation"

"Because the percent of modulation is
directly related to the loudness and
intelligibility of the signal produced
in a receiver, the higher the percent
of modulation that can be maintained
without producing distortion, the more
effective the communications can be".

Robert L. Shrader
Former Chairman of Electronics,
Laney College
McGraw Hill, 4th Edition,
Electronic Communication.....
(1980, 1975, 1967, 1959)

I don't know why you insist on arguing
and wanting everyone to prove something
when this has been common knowledge in
the public domain for almost 5 decades now!

Tell me Bill, which part of this DON'T
YOU UNDERSTAND?

Jack

http://www.angelfire.com/az/firecommunications/

"Do it right the first time or
don't bother doing it at all"!

This is a legitimate site. It has a lot of real good info on it. If
you look at the entire note you'll see that the call letters are for a
"Rgestered Scanner". Not a ham or other radio operator. Lot of
mititary info at this site seeing that the operator is near NFAF base.

From: 10 OHM SMOKE <peak-a-boo@mindspring.com>
Message-ID: <7so869$f9n$1@nntp8.atl.mindspring.net>
Source record: 3958

I never said that they were the best antenna. I run them on my vehicle because they work. To me they are the best. I have tried the others. I have not tried the monkey made. I do know that the predator 10k is the lightest antenna and the whole antenna is machined, nothing pressed. I also like the fact that the guy who builds these antennas will cover the antenna warranty. and this I can personally attest to, and I dont mean waiting for weeks to get your antenna back. I run a long antenna on the back of my vehicle and a short one on the front, I have smacked a couple of trees with the back one and the guy fixed them without any problems whatsoever. P.S. I also like the 55's they also work really well. they are built on the same concept (Machined) aluminum, but they are then welded and they use a flat material for the load coil and will handle more power, but they also cost more. and dont buy that antenna (102) at cb city, that is a heavy, pressed,plated piece of junk. spend your money on something handmade.

Chris wrote in message <7805-37EEAFA8-79@newsd-212.iap.bryant.webtv.net>...
The antenna that is advertised is an Xterminator 2. Its distributed and sold under a lot of different names.

Jack Thurston <fire228@cybertrails.com> wrote in message
news:37EF343E.3770@cybertrails.com...
Rollo_ver,

I saw the response to your question
about the missing frequencies from
27.415 - 27.445.....

look on the pc board between the rear
of the front face and the 8719.....
On the board you should see a couple of
short bare jumper wires side by side...
When one of these jumpers is removed the
frequencies in question will appear in
the radio.....I forget whether this
displaces any pre-existing channels from
the standard mod, but a switch at the
active jumper will take care of this
quite nicely.....

Hope this helps.....Let me know!

Jack

White trailer trash is too nice and quite generous--better to find out where he lives and if it is close, move away, or move him away. His comment is inappropriate here and anywhere else. An onlooker might perceive that ALL cbers share that ignorant, bigotted opinion which certainly is not the case.

You gotta change all the crystals to cover the ten meter band.

Crystals cost about 7-10 dollars each, save your time and
trouble...buy a 10 meter rig thats current!

BTW...23 channel radios were discontinued after 1977(1976) due to the
new 40 channels units!

Believe it or not I agree with you 100%. We have found that the 102 that we sell in the pre-packaged has turned out to be a flop. It does not hold together and the little plastic insulator that they put in them have a habit of breaking.

We of all people have to try new things as they hit the market. Sometimes they are winners, sometimes they are losers, but without someone trying them and giving us a report on their performance, we are in the dark.
We do no claim that all of our products are the top of the line, because not everyone can afford the pricy "hand-made" items, as no one can. All we can do is offer our honesty in admitting so.

Message-ID: <11683-37EFF32F-60@newsd-213.iap.bryant.webtv.net>
Source record: 3994

I took my RS TRC-485 AM/SSB out of my car and put in a Uniden PRO 640e AM/SSB that I got off of eBay and an Astatic 575. The 640e was never used and is in new condition, it was still in the plastic wrapper!!! I did turn the ALC pot all the way up and the AMC pot all the way down though. The power out of the radio is 4 watt, RMS, on AM. The question that I have is, whats the proper way to set this radio up to run an amp? Should I have it peaked by the local shop or leave the power stock with the mod limiter in tact? The amp and antenna setup that I will be using with the Uniden is a Silver Eagle 200 and an X-terminator II. Thanks

And I supposed, old fart that ye are, you have never heard of a typo on a keyboard, right?

I would lay 1,000 to one odds that if you look at my posts in the past, I will have less typos and misspelled words than most anyone on this newsgroup.

So, once again, Jack, you are an idiotic amateur technician that really has no idea what he is talking about.

I have been here since Bill Eitner professed the same BS that you are now... The difference is that he (as well as the Professor, to an extent) was willing to do some experiments, and learned a great deal. Now, he is one that will take the time to attempt to educate an idiot such as yourself.

It is a pity that you are so quick to "mimic" something that "has been known for 50 years", but then you are so quick to even open your own mind to something that has been discovered.... Either for the first time, or discovered anew!

So, let;s look at how far the panties of yourn got stuck in the crack of your arse! Please, Jack, see below:

> "Why not? Do you not realize
> that correct speaking is also
> a sign of correct thinking"?
>

Ahh.... But, oh he who loves to take everything out of context to attempt to prove a point that has nothing to do with the current discussion, I was not speaking..... I was typing!

And it seems to me that you got the point, even if the word was misspelled.

Does that mean that you got those panties up so far that you forgot the difference between the written word and the spoken word? Do you know the difference between verbal interaction with another human and the spoken word?

If not, I think we have another case in point for dropping the CW rules! Speach and typing are two entirely different mediums of conversation!

> "Well, it is"!
>

No, Jack, it is only a feeble attempt at your trying to discredit someone. That was proven above, where I had to show you that typing and speech are two different things.

> Jack
>
> OK OK lets not resort to
> misspelled words to try
> and prove that someone is
> not so "smart"!
>
> "It's true!

Is it true that when a person is typing on a laptop keyboard for the first couple days that when they make a typo it means that they are any less intelligent?

And if you are attempting to say that someone is not smart, then when someone calls you on it you rebuff your statement, then say it all over again..... Well, let's just say that the old shrink may still need a couple more sessions with you..

Roses are red
Violets are blue.
Jacks schizophrenic and so is Jack...

My, my, my... Jack can't even remember what he is talking about! Isn't that sad? They say the mind is the first to go!

BTW, the
> point was not brought up
> with any reference to
> "smarts", those are your
> words, not mine"!
>

But, you just said that it was true! So, if that is what you meant, why are you attempting to bag on another person for calling a spade a spade? I mean really now!

> (my words below)
>
> Poor Toll Free got so shook up
> that he forgot how to spell! (busshlit)
> believe me, resorting to these tasteless

Wait!!! You have got to love this one! Jack was so happy that he finally caught me in something that he could REALLY prove that he forgot the simple are of punctuation as well as capitalization! When you are going to quote, you would need quotes (these are quotes, for your future reference ".. You put them at the beginning and end of the quoted passage or word(s)) around the word "busshlit" and would need to capitalize the beginning of the next word, since it starts a new sentence!

Guess that means that you forgot correct grammer too, huh Jack! Now, who is the person in the wrong! I typo'ed a word... You forgot correct grammer, punctuation as well as capitalization!

Stop crying and get those panties out of the crack! I didn't mean to shake you up so bad!

> tactics while trying to defend your somewhat
> questionable points of view does nothing to
> lend any credibility to you or your tireless
> mission of continual "misinformation"!

Please quote where I have posted misinformation. Anything that I post has been backed up either by textbook example, my own experimentation or that of others. You are the one that is spreading "continual 'misinformation' ", and it has been proven by the people on this newsgroup respected by others.

>
> "Nothing in the above refers
> to either smarts or intelligence!

No, I seem to recall above that you said it did... I will quote for you, since it seems that you forget so easily (that old age thing again, I am sure...)

"OK OK lets not resort to
misspelled words to try
and prove that someone is
not so "smart"!

"It's true! BTW, the
point was not brought up
with any reference to
"smarts", those are your
words, not mine"!

So, Jack again has contradicted himself.

Nice try, Jack, but it just doesn't jive...

Your wrong.... again.... Please go quietly to the corner and lick your wounds. We won't be mad when you come back out. If you play nicely, people will respect you.

Play like you are now, and people will continue to run you down... And you make it so easy just because all we have to do is repost what you have written (not spoken... Typed or written would be the correct terminology here!!!) and it is proven for us!

Have a good day....

And remember... "Hooked on Phonics" isn't that expensive...

Toll Free

> I believe that loss of self
> composure was the topic here"!

Actually, due to what is called "skin effect" the radio waves only travel
along the very outside of the conductor. They would not even touch the
copper core. The actual problem is in the formula you are using. The one you
are using is for 1/2 of a 1/2 wave dipole with a length to diameter ratio of
approximately 10,000 and additonal "loading" from the end effect of of
insulators. In practice, the "electrical" length of any antenna is shorter
than its "actual" length because the velocity of an electromagnetic wave is
slower through a wire than through space. Many factors influence the actual
length needed to produce a resonant electrical length. Equations are good,
but they cannot be solely relied on. In any practical case an antenna must
be pruned to resonance.

3999. Re: Avanti Saturn AV-190 antenna party pictures

Newsgroup: rec.radio.cb
Date: 1999-09-27 00:00:00 UTC
From: Jay <jay123a@qnet.com>
Message-ID: <37F00FD8.40E26972@qnet.com>
Source record: 3999

Hello Landshark: Yes it is a Avanti AV-190 "Saturn", I don't know about the Saturn 5 part. One rule of thumb ya might half to accept here, is that the antenna may have had a few different names, there was so much CB stuff sold in the CB Boom of the 70's, I'll bet no one knows for sure who sold what. But the antenna manufactures did stop manufacturing a lot of antennas around 1978, 1978, & 1979, as the sun spot cycle pooped out, or skip conditions, along with the CB Boom/Craze market.

I don't remember for sure what these Saturn antennas where called. One of the locals had one, but mounted it only a few feet from the ground. And it didn't do well, I credit this with the poor installation. I tried to suggest a higher installation, but was told to but out. "Ten-4", I said.

I would think this antenna needs to be installed pretty high so that the horizontal ground radials have a chance to work.

No Avanti did not just remake it. The folks here who put up the neat web site found the antenna in its original installation since 1976, I believe. A class 1 install I would say.

The guy who bought out Avanti, and can sell parts and pieces, or the hole antenna is:

Tellem Jay sent ya.

For a Free assembly instruction sheet, for the Sigma 5/8 AV-170, or the Saturn AV-190 shown in the web site of this tread, contact:
Allen Telecom Inc.
Antenna Specialists Div.
Parkway Cleveland Ohio
44139-3996
Phone 440-349-8677 or at:
http://www.allentele.com/antenna/products.html

If ya tellem Jay sent ya, they'll water down your drinks and charge ya double!

The Sigma 5/8, Saturn, Penetrator 500, CLR-2, and many other antennas where stopped manufactured after the 70's CB Boom, and skip cycle. Also the cost of aluminum tubing has sky rocketed in price. Bill at Bills 2 way radio, told me, he sold me his last MaCo V58, and that the fiberglass antennas where selling 10 to 1 of the aluminum MaCo V58 antenna. This was in Feb. of this year. I hope where not seeing the last of the MaCo V58.

Jay in the Mojave

The problem with running caps is that they are EXPENSIVE!!!!

For the gentleman that had a pair, it would hurt nothing (and I will get into this later, as this is a qualified statement!!!) to add the caps...

However, if you are not overcharging your electric system (running 19 volts on a pair of golf cart batteries!), a cap does not do much good at all. Sure, it will filter out the <<slight>> bit of ripple present on the rectified DC, but if you have enough battery reserve, this will be done at that level, anyway.

The other thing to watch out for with caps is the AC RF component on the DC lines.... It is not uncommon to see many volts (sometimes nearly a hundredin the case of a large amplifier) on the DC lines. If you are running a 35 VDC cap, what happens....? Crackle!! Fizz Fizz.... Your car fills with a putrecent smoke, your car stinks, and you buy more caps... Most people are going to run a car audio capacitor, and that makes for low voltage ratings... On the order of 25 to 35 VDC... Exceed this rating, and poof..... Problem city!

If you are going to run a mammoth alternator, and an external rectifier, then yes, you can go with a complete capacitor system.... Their is an inherent problem in doing this, too...

1. Not many people know how to hook up a 3 phase AC to DC rectifier...
2. Their is a voltage "overshoot" when you unkey the amplifier. We use the cap / alternator method on some large systems here in Texas, but their is always a problem with the period of time from when the field completely collapses in the alternator and the time the amp unkeys... The current draw of the amplifier dies off, and then the voltage overshoots the threshold set by the regulator... This has been known to fry 2879s before.

The cure... The Dead Motor Maul. That is what we use. For people who don't want to spend the $$$ on the Dead Motor Maul, a couple batteries in parallel to the electric system will work, but the voltage overshoot is still their.

So, for the average Joe to want to run caps... It can be done, but rarely, if ever worth the effort. For a competition user, yes, it can be done, but remember, you don't get the luxury of battery reserve... And that battery reserve means a lot when you are running anything bigger than 8 transistors! Translate this into Alternators, alternators, ALTERNATORS!!!..... The DC current has to come from somewhere.

Now, on the flip side, to the battery method...

Pick the voltage level that you want to idle at, in 2 volt increments..
1. 14 volt
2. 16 volt
3. 18 volt
4. 20 volt (approximately).

Anything greater than that, and you will be frying transistors.

1. 14 volt system, use a bank of automotive batteries (although I have been trying out a Gell Cell pack... Using batteries for a commercial UPS system, I have outfitted 5 batteries in my Suburban.. at 35% charge, I am able to pull 1100 amps out of them for short bursts (each battery, mind you) at 11 volts. Great for keydown useage!!!). Use the rule of thumb I gave earlier, and this will work.

2. 16 volt system: Use 2 8 volt batteries. They make a golf cart battery, but that is not the best. Their is also a 8 volt battery that the old Model T era cars used. It is a good battery, but not very good at high charge / discharge rates... Fails earlier than other battery types. The best 8 volt batteries that I have found are the ones that are classified as a "Tug Bat" battery. They are prevelant here in Houston (international shipping port), are rebuilt due to the demand from ships, and hold a HUGE amount of current. Also, they seem to take being abused better than any other battery I have seen. I highly recommend them for 8 volt useage.

3. 18 volts system: Run 3X6 volt batteries in series. A combination of deep cycle and "normal" automotive work good... 3X deep cycle, in parallel with 3X automotive. The deep cycle will store a charge capable of quick charging the automotive batteries, which have the fast response time needed for quick keyups. Puts less of a strain on the alternator, as the deep cycle batteries seem to pull a little less current all at once.

4. 20 volt system: Run a automotive type battery and a 8 volt battery (although a 6 volt batterty will work, if you want to have a "soft" 20 volts. It will sag to about 18 volts under key, providing a safety margin). This is for the diehards, as it puts the most strain on the alternator and amplifier.

With a 16 volt system, you are the most versatile. I have run a 16 volt system and found that I could ru nit from 14 volts (charge the system at 16 volts, and under load, it will drop to app 14 volts) all the way up to 18 volts (and a little more, when the engine was revved up). You can keep the system charging at app 17 volts, or lower if you don't have an amp that will handle it), and when you upgrade, you are prepared to volt to 18 or more volts.

With caps you can do the same, but only to about 70 percent of the rated voltage of the cap.... And, if you have shitty bypass methods in the amplifier (read that as any of the mass produced "Battle Box" types of amps), you can and I have blown out the caps from RF being on the line.

Hope this long ass message helps someone.

Brad Kellison wrote:

> not without a load of rework on the final stage and main PLL or crystal loop

Oh really? If his radio is a 1984 model then it is a 40 channel PLL.
I have done many Uniden chassis by simply changing the loop mixing
crystal and retune the radio. It doesn't have all the power on transmit
or sensitivity on receive that it did as a stock cb, but it's more than
adequate. The biggest problem is finding the right crystal at a good
price. I have a Montgomery Ward 719 that I converted recently and
it works great. Piece of Cake.

Not to take sides on this issue but: Did this article come from the ARRL? If it did, read it with "tongue in cheek".

Some years ago, here in RI, a woman's TV was being interfered with by a CBer. This person called a neighborhood friend, who was a Ham, for advice. The two actively solicited the FCC for some sort of enforcement action which never came.

All of a sudden this same gentleman (The Ham) was also receiving interference from this same CBer (It was a miracle because this CBer had been on the air for 2 years prior). He himself began soliciting the FCC stating that his "Nets" were being interfered with by this same CBer.

The FCC almost immediately responded and proceeded to pounce on a 14 year old kid (really his parents). Now I'm not saying that this is the case, however, things are NOT always as they appear to be. Just because someone is a Ham, doesn't necessarily mean their motives are pure. Of course this story made it to the illustrious QST magazine, however the part about the lady with the television was somehow forgotten in the printing of the story.....hmmmmmm.

The ARRL could put ANY spin on ANY article. READ the article carefully. It doesn't really say anything other than conjecture. I personally don't believe a word The ARRL says because they are so subjective, it isn't even funny.

Just think Bill, you made it to the big time, The ARRL will probably be using this article for code practice on 80 meters.

You forgot to read the directions!! Average ratings is how it is calculated! For CB we are talking about an AM signal which, by definition, is calculated at 100% duty cycle. Single side band is calcuated at 20% duty cycle. So, again doing the math for you because it seems you are slow at this, assuming a 2000 watt pep signal and single side band at 27.185 MHz, the AVERAGE power out is 268 watts, not 2000--only 268 because of the 20% duty cycle--you still have to be 15.58 feet away to be safe under the regulations. Increase the pep power to 3000 watts and it will average to 402 watts and again assuming no antenna gain, the safe distance is 19.07 feet. This means that the antenna must be 19.07 feet away from the closest human or part of human to be considered safe. Do you get it now? You can't operate that kind of power from a mobile and be safe from rf exposure. No shit here about the car body protecting you--no shit here about other people in the car next to you can go to hell. It doesn't work that way. With that kind of power, you aren't even CLOSE to being safe. Any more questions? Your screen name says it all.

Oh, by the way, if one of the big kw+ stations you are scared of was operating legal limit on phone at 14.195 MHz, the normal amateur dx calling frequency, he could be just over 7 feet away from the business end of that antenna and be safe. RF exposure limits vary with the frequency. That's why it doesn't take much rf to cook that chicken in your microwave.

Duane,
If I wanted ssb I would get the PC-122XL(84.88) with a wilson
antenna(any of them are good) I ve own three and all have performed
flawlessly. If you want am only, I would go to http://bills2way.com
and get a PC76XL.(84.88) Best AM only uniden ever made.
The grant is an excellent radio dont get me wrong, one of the best
am/ssb mobiles ever made, but for basic communications, put the
difference in the antenna, it will be the best bet every time.

I am new to this CB business. I have purchased a used TRC-449, which has 3 modes, AM, USB, and LSB.
Unfortunately, I have no idea what these mean or do.
I have not installed the radio in my car, because another radio I borrowed had a box of some sort between the radio and the power supply; this one doesn't.
Someone told me this was a noise suppressor of some kind and I don't need one.
I would like to learn about this radio, its needs and capabilities before installing it.

Thanks

Marty

That's a great answer for a legitimate question. :-(Grow up. If your use of the CB is only going to be casual, then a mag mount on the roof might be adequate for short distances, but the shorter ones aren't going to work well, and the longer ones will work better but get in the way. If you are thinking of something more permanent, consider the outrageous expense of a light duty trailer hitch mount on the back. Your car has plastic bumpers so it isn't possible to mount anything there anyway, but you need an electrical route to a chassis ground, and a hitch mount would offer you this, and would offer the opportunity to mount a longer, more efficient antenna. The mobile antennas generally require a counterpoise to work properly and that is normally the metal body of the vehicle.

Note the electrical wiring on the radio and wire it directly to the car's battery using multistranded wire no smaller than 14 gauge. Avoid anything like "speaker Wire", but try to find a pair in two colors so that you won't make a mistake and reverse the polarity. Fuse the positive wire just as it leaves the battery with a fuse no larger than 10 amps. Buy the best possible antenna your pocket can suffer because the antenna is twice as important than the radio itself in communicating. Route the coax from the antenna to the radio in such a way that it avoids anything at all related to the cars ignition system, and if possible, keep it away from anything else that is electrical. Borrow an swr (standing wave ratio) meter from a friend and check the value of the antenna when the radio is keyed. The less the needle moves the better, but if it stays under 2:1, the radio will tolerate it. Most antennas have some adjustment in their overall length, and the length of the antenna in large part determines the point of resonance which is what you are trying to achieve.

The radio offers you AM, upper side band and lower side band. Look at either side band as being half of the AM signal, compressing the information into a smaller area. A side band signal will travel farther, but fewer people have access to it and most local CB work is done on AM. Both are useful for what they do.

Don't worry about adding any filters to the electrical or coax until you find that you really need them. Since you are on the internet, go to www.fcc.gov and search the site for the Part 95 rules and take a look at them. These are the regulations which control operations on the CB frequencies, and you should at least have a passing knowledge of their content.

Every microwave I've seen has at least 700 watts at 2,450 MHz bouncing
around in a small metal cavity. I'll worry more about nutrasweet
turning back into acid above 86 degrees. It causes acidosis and
symptoms like lupus. But red dye #5 is bad for you in mega doses.

Rush LImbaugh is too liberal for my tastes, and he talks about himself too much. While he's right about some things,
he's really a "heat sink" where conservatives go and waste their time and energy listening to him avoid the REALLY
important issues ... such as the fact that
Whites are quickly being overrun, and will
soon be a persecuted minority in their own land if they don't wake the hell up and do something about it.

Gary Danaher <gdanaher@flash.net> wrote:
> That's a great answer for a legitimate question. :-(Grow up.

The advice you refer to is in response to my comment about playing with truckers. It wasn't bad advice, but I play nicely. They like it ;-)

I bought a K40 and a mag mount. I haven't gotten around to trying it out yet. I'll try to mount it on the roof, lower than I had the other one. The K40 should hold better. If not I'll try the trunk lip mount. A local CB shop told me that wouldn't work well because the trunk lid is aluminum. I thought it was plastic. In any case I'll try it.

I like the trailer hitch idea but my needs are modest. On the other hand I have a friend who would install it for the cost of parts...

Thanks for the suggestions.

Amy

Antenna question...

What's the advantage of having a dual air-wound coil vs. a single coil on center loaded antennas? Is there a significant increase of Gain with a dual coil?

-Skorzy

4037. Wilson vs. Penetrator

Newsgroup: rec.radio.cb
Date: 1999-09-28 00:00:00 UTC
From: skorzy@SPAM_KILLER.mindspring.com
Message-ID: <skorzy-2809990029330001@user-2ive96m.dialup.mindspring.com>
Source record: 4037

I've got a Wilson 1000 mag mount on the top of my Tercel matched with a Uniden 76XLW with the modulation mods, but running at a legal 4 watts. The SWR is about 1.5-1.6 on all channels. The antenna performs fairly well.

However, I used to have a 12" shafted Penetrator II antenna on top. The SWR was comparable to the Wilson. Performance was likewise excellent.

I've noticed that the Wilson doesn't pick up as much of the engine noise through the antenna as the Penetrator does, which allows me to keep the squelch at a lower setting, thus allowing more distant calls to break through. Thus the reason I switched to the Wilson.

What I don't know is if the Wilson is giving me the same transmission/receive ability as the Penetrator. Do the Penetrators have a higher gain? Is this only because its a centerloaded antenna? I would think that the increase reception of the engine electrical noise in the Penetrator, that necessitates a higher squelch setting, would actually make my reception worse than the Wilson, thus making the Wilson a "better" antenna for my vehicle.

I'd like opinions/comments... but please keep in mind I'm not a "Power DXer" and wish to avoid any "baseloads suck" chatter.

Thanks.

-Skorzy

If copper conducts an RF signal "faster than stainless", then the antenna
would have to be longer - not shorter. Think about it.

Go to your local library and look in copies of the Radio Amateur's
Handbook. The older copies have such antennas - I don't have a recent
copy, but suspect they may as well.

do not buy a base loaded whip go for the center loaded whip
or a top loaded whip

people say a base loaded whip is quieter

that is becuse they can't hear any thing to start with

you will hear normal band cluter and with the squelch off
and the ANL off
and static any time of the day if not
the antenna is not working

Tinker,
All of the Texas Star Amps except the 75 watt modulator have a manual SSB delay.
If you have a 225 palomar I have a mod to take the delay out and put it on a switch(thanks to Jscotty at Scotty's radio). If you are interested in the mod I will be happy to E-mail the details to you.

4053. hear comes the vector calcs

Newsgroup: rec.radio.cb
Date: 1999-09-28 00:00:00 UTC
From: n9wosss@worldnettt.attt.nettt
Message-ID: <37f10524.8407919@netnews.worldnet.att.net>
Source record: 4053

some say that real life is not calcs but
i had plenty of experience with them
that is why i took the time to figure out
why they did not work very well

this is why i will never waste my time
with a base loaded agen

take a 8 foot whip for simplisity that can be
devided in to 8 one foot chunks

the starting phase is at 0 at half the feed point current
the retern phase is makes up the other half
and we just want percentages real feed point resistance
is not of concern so lets make up a resistance of 4 ohms
and a radiation resistance of 1ohm per foot

ther for the input will be 4 watts at 4 volts and one amp
that should make calcs a bit simpler

·_·_·_·_·_·_·_·_·_·

first node which is the feed point
out going phase .5 amp at 0 degrees
incoming at .5amp at 0 degrees
toatal 1 amp

node 2
out going at 11.25
in at -11.25
cos,11.25 = .980

average .99 amp at one ohm =.99volt
.99 *.99 =.98 watts for number 1

node 3
out at 22.5
in at -22.5
cos,22.5 =.924
average .952 at one ohm =.952 volt
.952*.952= .906 watts for number 2

node 4
out at 33.75
in at -33.75
cos,33.75 =.831
aver .88 amp = .88 volt

.88*.88 = .77watts for number 3

node 5 the center of the antenna
out at 45
in at 45
cos,45 =.707
aver .77amp =.77volt
.77*.77 =.59watts for number 4

node 6
out at 56.25
in at -56.25
cos,56.25=.556
aver ..63amp =.63 volt
.63*.63=.39watts for number 5

node 7
out at 67.5
in at -67.5
cos,67.5 =.38
aver .468amp =.468 volt
.468*.468= .21watts for number 6

node 8
out at 78.75
in at -78.75
cos 78.75 =.2amp
aver .29 at .29 volt
.29*.29=.08 watts for number 7

node 9 top of antenna
in at 90
out at -90 (note phase reverses at open end)
cos,90 =0 amps at 0 volts
aver .1amp at ..1volt
.1*.1=.01 watts
chunk output
1 .98
2 .906
3 .77
4 .59
5 .39
6 .21
7 .08
8 .01
total 3.936 watts about right takin acount fot
the rounding of hear and ther
1 to 4 output 3.246 or 81.15%
5 to 8 output .68 or 17%

3 foot base loaded whip
with no network at the base

just loading coil
.3 watts out or 7.5%
you can say that the swr
will make a current node at the
base of the antenna well lets look
50 ohms at .3 amp at 15 volts or 4.5 watts
in to 4 ohms
swr generates twice the current so input is
.6 amps so 16% but
the cerculating current is 12.5 times that
so you have 12.5 times the coil lost and
other losses so you end up obout the place
you started

and a whip with a network in the bottom
it will transform the 50 to 4 to drive the whip
but the cerculating current will be 160 times the
normal they state it will be 50% or more efficient
but with 40 to 50 amps cerculating current it is not likely
most likely about 10%
3/4 of the power will be lost in the base to car gap
and trunk lid mounts will nead 0 gage brade to connect
it to the frame
and lets not even talk about the loading coil losses
at that current
some companys just have nicrom wire for the network
that gives you about 50 ohms
why do you think they nead such a big base loading coil
that is so it can disipate the transmiter power
and receve is still about 8% even less now becus
of the loss in the network

on a two foot center loaded whip you get
about one watt out on the lower part
and the top basicly serves as a tuning
stub with only about .1 watts out
which givs you about 25% output
and that is on receve to

that is why bumper mounts are junk
becuse the lower 2 to 3 feet the of antenna
is renderd useless

ex the spelling

There is a delay for SSB, but on SSB you pretty much have to have some delay in the keying circuit or it will chatter because there is no carrier. The delay on the Texas Star is not as bad as some of the palomar amps are, But you shouldn't need any of this on AM as you probably already know this.

Buy a schematic of both radios.

Compare.

Your wrong.

The only thing that was different was that the base used a crystal filter,
and some of the mobile radios bypassed the Xtal filter with a cap.

That had nothing to do with TX of the rig... Only the RX selectivity.

Not true.

The coil type antennas will show more "gain" in the horizontal pattern than will a non-coil antenna.

The non-coiled will have more "apparent" gain than the coiled antenna when measured against a verticle reference.

All in what you want to talk. I have better results with a double coil Dr. Crow for skip, but the Black Al Capone and Triple Duece single coil work better locally.

Only when you push in the SSB switch. That is one of the functions of the
switch.

That will also show you the quality of the amp above the others on the
market....

Pretty shitty when a manufacturer won't spring for a dollar switch, eh?

Message-ID: <G3bI3.3094$Ph7.13275@insync>
Source record: 4064

Excuse the spelling, as well as the misinformation!

The double coil antennas concentrate more of the signal in the horizontal plane, argueably increasing the skip that the antenna can work (some people say that a horizontal antenna will work DX better.... I tend to agree, mostly because most noise has been proven to be closer to vertical polarization).

So, yes, the double coil will have more gain to a horizontal antenna, but the single coil will be better suited to a vertical antenna.

Hope this helps to clarify a bit, as well as dispel the myth that the other gentleman was attempting to cram down your throat.

What a bunch of bullshit.

The Wilson picks up less static from the engine because it is a DC grounded antenna, not because it has less "gain" than the Penetrator.

The Penetrator will be a little more widebanded due to mechanical and electric construction, but the Wilson will have a "quiter" RX due to the fact that it is a DC grounded antenna.

This fact lets the static "bleed off" rather than be propogated down the coax to the radio.

The Wilson base loaded antenna has become more or less the antenna to beat when talking about ANY type of mobile antenna.

You are obviously not very competent when it comes to RF today... Maybe for the days of 20 or so years ago, but so far everything you have said that I read today was wrong. Dead wrong.

Go back, bone up, read a book (learn to read if you have to first), then you can come to the newsgroup and propagate real technology...

Not antiquiated myths.

4070. Re: Class A,B, or C Amps

Newsgroup: rec.radio.cb
Date: 1999-09-28 00:00:00 UTC
From: Toll Free <tollfree@bigradios.com>
Message-ID: <Odbl3.3098$Ph7.13255@insync>
Source record: 4070

Those radios have no "over-SWR protection" in them.

The only type of protection that they have is overheat, and that is done through a simple thermister.

The problem that you are seeing is because of a higher than what is called for input impedance on cheaper or bad amplifiers.

A transmitter will put out 4 watts into a 50 ohm load...

It will not put out 4 watts into a 75 ohm load (way less, as a matter of fact, and this is a 2 to 1 swr).

Consequently, when driven into a 40 or 30 ohm load, the SWR goes up, but their is more current in the feedline to the box, resulting in greater drive!

Yes, I am.

Before Hollingsworth we all enjoyed ourselves and stayed
to ourselves. We never bothered anybody. The only people
that concerned themselves with us were the anal types
that saw something illegal and had to stick their brown
noses into it. Now, if one of us gets too carried away,
we get a warning letter or have to retest. You'd think
the pollbutts would be happy wouldn't you? They're not
and they never will be. We still manage to say and do
what we want within the confines of Part 97. So, they
tape every word we say so they'll have a record of any
violations. We have our hobby and they have theirs.
It all works out just fine.

Hey now, he did ask a legit Question!!
For an Escort, just be sure the radio transmits clean, if it dont you may have problems with the onboard computer for your car. I've heard of that happening before with both hams and non hams.
(for clean, no spikes or spurios emissions, some could fool the computer into thinking theres a problem)
Hope this bit of advice helps you out.

Just curious, Would you mind if the covers were also bent at a local fabricating shop then painted?
If looks dont matter you might be able to get better shielding, even better air flow thru radio to keep it cool during heavy usage.

For that matter, a Rip-Shack mag mount would work better than
a thru-glass antenna. Put a cheap radio on a GOOD antenna.
You can always get a better radio later. A cheap antenna is
forever. (You'll be stuck with it!)

I agree. The regulator fix is easy and common knowledge
these days.

> I run a 2950 in my truck. I've had it for 7 or 8 years now. I've taken

> that of another radio with high level modulation.

Here, I disagree. In my experience, you have to
lower the carrier to 5 watts before you'll see
100% positive modulation on a scope. The modulation
envelope peaks are alot more rounded too. The
waveform doesn't look like a textbook AM modulation
envelope at all. You can see the effect of the
linear stages that the signal has been put through.
Comparing tuned-up radios, the diffierence between a
2510 and a 2950 on AM using a scope or a monitor receiver
is very clear. The only way to make a 2510 even
come close is to reduce the carrier to the point
where the maximum peak power begins to drop. That
happens in the 4 to 5 watt range. At that point,
you've got all the positive modultion you're going

to get. The sound isn't too terribly bad, but the
high-level AM "bark" just isn't there. I don't
like the fact that you lose peak power when you
lower the carrier below about 5 watts either.
That compromises the performance when using CB
amps that show symptoms of overdrive if the carrier
is above 2 to 2.5 watts.

On the other hand, the 2510 will show higher peak
power output with a simple tune-up on SSB than a
2950. They have a nice, stable SSB sound too.
If a guy could handle the lower tech CPU with its
lack of features, and is only interested in SSB,
the 2510 (or Lincoln these days) may be a better
choice for some than the 2950.

> The one thing that you do have to be careful of with a 2510 (and the

> forward swing and all back swing.

That's interesting. I've never noticed that effect.
My backup radio is a Jackson. I'll have to run it
into some loads other than 50 ohms to see how it
reacts.

You'd figure the opposite of what you say would be
true. On either side of 50 ohms, the control
circuit should reduce the output. There shouldn't
be a condition where the output increases.

The difference here is that Ranger offered it
themselves knowing that some hams are interested
in 10 meter FM repeater operation. As I remember,
it's spoken of in the owners manual. In other
words, I wasn't talking about a totally aftermarket
unit. However, since I've never followed it up,
there's nothing saying that Ranger ever produced
a custom PL board for those radios. There certainly
are no empty sockets inside the radio to ease the
installation.

From: Jay <jay123a@qnet.com>
Message-ID: <37F15EA5.37388773@qnet.com>
Source record: 4090

Hello All: Looking for a Hy-Gain Penetrator 500 5/8 CB Base Antenna, in any shape or condation. I'll take new in the box, to a old one thats been up for thrity years, to a melted down mess from a lighting strike.

Look at http://www.cbgazette.com/gaz2.html and click on "reader mail" in the left hand colum for a picture of a Penetrtor 500 5/8 CB Base Antenna. This is Woody World CB Radio site.

Thanks.

Jay in the Mojave Desert, its gettin under 100 degree's, better get ready for winter.

4091. Added CB Manuals/Modulation Info

Hi all:

I have added more manuals to the list, there are approx.
8 on Portables, 24 on Mobile's, and 5 on Base Station's,
added to the existing page at the following:
http://home.att.net/~j.dow-kb2tlb/pages.html/servmans.htm

Also, if anyone is interested, I can make up Modulation &
Tuneup Guides, for any of the radio's listed, for onk\ly $6.15, shipped.

For other related CB info, please visit the following page:
http://home.att.net/~j.dow-kb2tlb/home.html/mypage.html

And for CB Fotofacts, visit the following, direct link:
http://home.att.net/~j.dow-kb2tlb/home.html/phfact1.htm

Tnx,
Jim/kb2tlb

end

i have had wilson antennas befor i have had a lot of experience with
them peaple do not under stand simple things just becuse you pay
more for it don't mean it is better i am quite competent with rf i repare
all of my own equipment including cars and vans we have not took a
vehical to a repar shop in over 7 years i have a old hw 101 heathkit that
when i got it only did about 1 watt i re tund it chaged all the old resisters
becuse they wer old carbon composision and had chaged value to the point
it wass useless it had it wass screwedriverd to deth by a dang cb'r
i will never be able to git the 29 to 29.5 segment working he was
tring to git it on 11 metters he also vaporised the 6146,s had to pay
50$ for a new set did not have any others around to put in

and 20 years ago i was only 3 therfor i would not know about that

i work on my own computer they mite be a bit out dated but they work
i like to see what i can do with the most basic stuf and how to get the most
out of it most people do not care about having a good antenna becuse
the cb channals are so cramed during the day that they can not tell the
deference
i have had may locals around hear come and ask if i could help them
they wer not able to git out over 2 to 3 miles
usaly runing some base loaded whip some times a k40 other times
a kmart no name two or three times a wilson 1000

i would just go to the house and git a spare 10$ antenna
that i get from jcwhitny slap it on the top and it blows ther wilson
1000 away
around hear ther is not much nois you can drive around
with the squlch of and never know it till you pass under a
noisy powerline
taking in to acount that the car is in good working shape
and not generating static on its own

some have just piched the 60$ base loaded antenna in the weeds
and no the antennas wer in perfict shape no broken coax or any thing

one dud could not talk over 3 miles when the antenna was installed
he whent home to test it i was on another moble becuse the base
antenna was down i had no amp in the moble and never had one
in it and never had a amp in the base station ether
when he was 5 miles and still perfictly readable he was serprised
when he was 10 miles away he was stuned when he was
15 miles away we was able to talk fine then some big skip came
in when the band opend up and bloted every thing out
if the skip had not came in we would have reached about 20 miles
max with the base up about 40 feet we could have got about 30 miles
i whent about my other dutys when he puled back
in the drive about 40 minits later and tryed to give me 80$ for my job
i stated the thing only cost me 10bucks he demanded me take 20
so to git the person to shut up i went oook when he was giting
in the pickup he stated ow yea hear is the old antenna
and throwed it on the ground and left i canablized
the wilson 1000and made a 6 meter moble out of it

electronics is my hobby and i am quite competent at it thank you not
i have ran the stuf on a antenna modiling program for kicks and
it spat out the same thing my calculations did

That's rms voltage is .707 of peak. This .707 conversion factor is
referring to voltages or currents, not power.

the static that the radio hears is in its pass band (ie) +-5khz from carrier
if it bleads of that then it is also bleading off singnal which is at
same frequency the other dud,s signal is not any deference from the static
same frequency so the antenna should respond the same

he should take time to fix the nois problem that will help all the way around

Toll,
Would this also be the case if the Penetrator was attached to his vehicle via a mag mount? Or were you assuming that the Penetrator had a hard connection to the car body. I guess I'm assuming that the mag mount gives the Wilson its DC grounding.

Dale.

We are not talking about phase change, we are talking about polarization.

It is plainly obvious that you have an inkling of what you are talking about, but the words get all jumbled up, right?

Anyway, I hate to disagree with you, but two people have spent the time to actually MiniNEC the antennas (Xterminator double coil, a Francis, and a few others). Their findings corrolate with what I have said.

I wasn't so sure that I believed it, so I too the initiative to test myself.

I used a quarterwave (102" whip), a double coil Dr. Crow and a Black Al Capone single coil.

The Quarterwave was the worst performer into the flat side of my beam (A Maco M-103 is what I use for RX, choke fed at a hight of 72" to the boom), then the next worst performer was the single coil Black Al Capone, then the double coil Dr. Crow. The crow was about 7 pounds (into a Kenwood TS-440SAT for RX), the Al Capone at 4, and the quarterwave whip was near 2.

Then, on to the ground plane, a Penetrator 500 at nearly the same hight.

The results where damn near backwards from above..... The Black Al Capone was better into the ground plane, then the 102" whip, then the crow.... In that order.

I don't think that you can argue with measurements. I took these at 10 miles from the location of reading, so their was no near field strength readings or leakage into the coax. Power output was varied, and the mesaurements stayed the same (this was done to take into account any near field reflections from the vehicle itself, a 1996 Chevy Suburban.)

>
> and the shorter the antenna the wider the mane lobe

You mean the shorter the radiator, the less concentrated the main lobe will be... Semantics, but you can take your words and construe them to be whatever you want them to be.

> ther is not any magical antenna that will git you grate gane

Sure their is.... The 8 element beam in my backyard! I GUARANTEE you it will outperform your 102" whip on 27.025!!!

> if you want to work skip git a 1/4 wave on the cennter of the
> roof

Not from my real world measurements, nor from my real world experience! The 102" whip, while being a good all around reference, is not the end all for antenna performance.... You have to weigh what you want to do. For someone who just wants to talk to his friends, mobile to mobile, the Dr. Crow would suck, but from a skip standpoint, it is DB ahead of the 102" whip!

most likely a tripod mag mount if you do not want to drill
> holes

A mag mount for a 102" whip?

Your putting a choke on the feedpoint, right?

Otherwise, you just made a nice bazooka antenna!

>
> or a 3/4 wave colinear but it would be 27 feet tall if you wanted
> to work the real dx
>

A 3/4 wave colinear......

So your going to stack 3 1/4 wave antennas? Why?

The lobe pattern would suck at HAAT!

The static that the radio hears is in its pass band. (in another words) +-5khz from the carrier
If it bleads off that then it is also bleading off singnal which is at same frequency.
The other person's signal is not any deferent from the static.
It is at the same frequency so the antenna should respond the same
He should take time to fix the noise problem.
solving the noise problem will help all the way around.

DC building up on the coax will not bother the radio unless it gits very high then it will just blow it up.nuke it. friy it or any way you want to say it

dc and other wide band noise should be toataly filterd out.

if you hear noise at other frequecys then the radio is under filterd and otherwise junk git a good radio

If the noise is in the pass band then the noise can only be stoped at the place generating it.

> i have had wilson antennas befor i have had a lot of experience with
> them peaple do not under stand simple things just becuse you pay
> more for it don't mean it is better

Your right.... But, in the case of the Wilson, it is one of the antennas for all around general use that is the one to beat!

Sorry, but you cannot argue with this fact.... People have been using it for a reference for years.....

Why?

Because it performs great! I own two, but I don't run them. I use one for a loaner, and the other for rental cars on vacation / work trips.

I have a garage full of mobile antennas, and typically run the best that is available at the time.... The Wilson is still that for a general purpose antenna.

> i am quite competent with rf

I don't believe you. Everything you have said today has been rebuffed by more people than you could care to imagine. Hell, even the Professor would argue some of your points!

>i repare all of my own equipment including cars and vans

O.K., so you are an auto mechanic. What the hell does that have to do with RF? We don't use spark gaps anymore!

we have not took a
> vehical to a repar shop in over 7 years

That means nothing to CB radio.

i have a old hw 101 heathkit that
> when i got it only did about 1 watt

Then the comment you made about the 6146s below is false. If a tube has been vaporized, the gold is stripped from the grid, and their can be NO emmisions, making power output absolutely impossible.

Once again... Proved wrong.

i re tund it chaged all the old resisters
> becuse they wer old carbon composision

I have a SB-220 and a DX-100 that is all original, sans a couple mods to the SB-220 for input and bias. Other than that, they are all working with the

original equipment. Same with my Johnson Viking (1953) and my Hallicrafter HT-41 amplifier. If you would like to compare antique radios, I am sure that I would win... Maybe not, but I think so.

and had chaged value to the point
> it wass useless

Then the resistors had been overheated. BADLY!!!! Resistors don't change value with age... Capacitors do. Do you know the difference?

> it had it wass screwedriverd to deth by a dang cb'r

OOOHHHhhhhh!!!! Now we are "dang cb'r"s, eh? Nice to know that the Hambobo comes out in you, too!

> i will never be able to git the 29 to 29.5 segment working

Why not? If the VFO is working at any segment, you should be able to get it working anywhere else. The only thing that can go wrong is parts, and their is not a part in the HW-101 that is not still being made today! You may have to modify the capacitor, but that is about it.

I think we are seeing more of your inexperience or inexpertice at work here!

he was
> tring to git it on 11 metters

And that is fairly easy to do. Change a couple Xtals!

Whoomp, there it is!

> he also vaporised the 6146,s had to pay
> 50$ for a new set did not have any others around to put in

I addressed this earlier. You don't know what a "vaporized" tube is.

Could be that he mistuned it, and that caused problems, or the 6146s could have been old (they are getting up their in age, ya know????)

>
> and 20 years ago i was only 3 therfor i would not know about that
>

Great. You are 23. You still have a lot to learn.

> i work on my own computer

Once again, what the h@ll does this have to do with the CB radio?

they mite be a bit out dated but they work

Great. I am a Senior Network Engineer and report to the CIO of a nationwide real estate management firm. Does this mean that I can work on a CB radio?

> i like to see what i can do with the most basic stuf and how to get the most

> out of it

Great. I think that we all do that.

most people do not care about having a good antenna becuse
> the cb channals are so cramed during the day that they can not tell the
> deference

That is utter BS. People want a good antenna during the bad times because it is a lot easier than a linear! Antenna sales are higher during the peak sunspot cycles because of new blood to the hobby as well as people upgrading.

Hell, at 23 years old, I doubt that you could recall the last sunspot cycle!

> i have had may locals around hear come and ask if i could help them

People inexperienced always ask people with slightly more experience! That does not make you a technician, though! Far from it, as a matter of fact.

> they wer not able to git out over 2 to 3 miles

That is bad, depending on what they where running.

> usaly runing some base loaded whip some times a k40 other times
> a kmart no name two or three times a wilson 1000

If they where unable to get more than 2 or three miles from a Wilson, they needed to have a real radio put on it, the coax replaced (broken) or the SWR set. I regularly talked from Las Vegas, Nevada to St. George Utah with a 667 on a Wilson to my base in Utah. REGULARLY!

I could also talk from Mesquite Nevada to St. George (40 or so miles) with a barefoot radio. 148FGTL.

You are full of crap, or REALLY don't know what you are doing.

>
> i would just go to the house and git a spare 10$ antenna
> that i get from jcwhitny slap it on the top and it blows ther wilson
> 1000 away

You are full of shit. Unless they had a broken coax or antenna, the Wilson would have gotten farther than 2 or 3 miles, especially if what you say next is true!

> around hear ther is not much nois you can drive around
> with the squlch of and never know it till you pass under a
> noisy powerline

So, then, the Wilson would have been an even better candidate! Being a DC grounded antenna, it will pick up less engine static, thereby reducing the noise level even more!

> taking in to acount that the car is in good working shape
> and not generating static on its own

>
> some have just piched the 60$ base loaded antenna in the weeds
> and no the antennas wer in perfict shape no broken coax or any thing

Sorry, but your full of shit. Gotta call a spade a spade, and you are full of shit.

>
> one dud could not talk over 3 miles when the antenna was installed

he should have shot the person who installed it then, because they ripped him Hoff!

> he whent home to test it i was on another moble becuse the base
> antenna was down i had no amp in the moble and never had one
> in it and never had a amp in the base station ether

> when he was 10 miles away he was stuned when he was
> 15 miles away we was able to talk fine then some big skip came
> in when the band opend up and bloted every thing out

Sorry, but skip does not "roll in" in a matter of 5 minutes. Not the magnitude that you are talking about.

Once again.... Full of shit!

> if the skip had not came in we would have reached about 20 miles
> max

Pure conjecture on your part. How can you tell me how it would have worked if you didn't do it?

>with the base up about 40 feet we could have got about 30 miles

Pure conjecture on your part. How can you tell me how it would have worked if you didn't do it?

> i whent about my other dutys when he puled back
> in the drive about 40 minits later and tryed to give me 80$ for my job

Right. I have a nice piece of surfside property in Nebraska for ya, too!

> i stated the thing only cost me 10bucks he demanded me take 20
> so to git the person to shut up i went oook when he was giting

What does "oook" mean? I couldn't find that dictionary definition anywhere...

Sorry.

> in the pickup he stated ow yea hear is the old antenna
> and throwed it on the ground and left i canablized
> the wilson 1000and made a 6 meter moble out of it

So, the ignorant shit that came to you in the first place took a brand new antenna and threw it on the ground after you replaced it with a 10 dollar

pile of crap?

Sounds like you two are a match made in heaven! The idiots leading the idiots!

Why wouldn't he just take the antenna back? Wilson offers a guarantee!

Wait.. I bet you never told anyone about that, did you? Makes for a nice antenna farm for free.

>
> electronics is my hobby and i am quite competent at it thank you

Not by what you say here. In the last 15 minutes, I have had 10 messages delivered about you, and not one defended you.

Guess what that means? Most of them where from people I consistently fight with, too!

Your competence is only in your head....

not
> i have ran the stuf on a antenna modiling program for kicks and
> it spat out the same thing my calculations did

What modeling program did you use? I am just DYEING to know!

>
> ex the spelling

how can I... Usually I have to attempt to decipher what the hell you mean, and I counted not ONE period in the entire diatribe that you just spit out.

Sorry, but I have to put you in the same category as JScotty@aol.com and CBKing.

You are just barely above the illiteracy mark, and have a beginners relationship with electronics fundementals.

That does NOT make you competent in any way, and you have surely shown it!

Sorry, and have a nice day.

Please purchase a copy of Bill Orr's Radio Handbook and the ARRL Handbook for the Radio Amateur as well as the ARRL Antenna Book.

Once you have done this, and can tell me the correct way to built a 4CX350 amplifier, I will be able to converse with you. Until then, you are nothing but an illiterate shadetree mechanic that believes he knows what he is doing with a CB.

Sorry, truth might hurt, but I am tired of your babble.

> The static that the radio hears is in its pass band. (in another words)
+-5khz from
> the carrier

WRONG!!! That would be classified as Adjacent Interferience!

Static is the noise that is naturally generated by nature, given off by other electromatic forces or generated by vibration from two metal parts.

Static has NOTHING to do with the selectivity of a receiver!

I have given you more credit than you deserved. I thought that you had enough sense to at least understand the basics of radio theory. That comment above proves me wrong.

> If it bleads off that then it is also bleading off singnal which is at
> same frequency.

WRONG!!!

The static is a more or less wideband signal. The DC grounded antenna uses the choke effect of a coil to keep the wanted signal from ground, but keep the feedline at DC ground potential.

This also serves to match the antenna to the "50 ohms" feedpoint impedance.

Once again, it has nothing to do with wideband static. It is a "notch filter" of sorts, that only passes a small amount of frequencies, with a Q of less than one in some cases.

> The other person's signal is not any deferent from the static.

WRONG!!!

The signal is completely different from static.

Your posts are no different from static, though! Both should be considered trash and thus useless!

> It is at the same frequency so the antenna should respond the same

WRONG!!!!

Obviously you have never seen a spectrum analyzer, right?

You would see that static usually stretches from DC to near daylight!

Get a good 5 or 10 gHz Spec-An, and you will see in the time domain what I am talking about!

Until then, you know nothing about the subject!

> He should take time to fix the noise problem.

Well, something we can agree on. However, this is not always economically feasible.

> solving the noise problem will help all the way
> around.

Yes, it will, but see above.

>
> DC building up on the coax will not bother the
> radio unless it gits very high then it will just blow
> it up

DC on the coax will do nothing to most modern transmitters as they are capacitively coupled to the antenna. But, you don't know the difference between a capacitor and a resistor in another thread, so I forgive you for this statement.

DC grounding passes the majority of the widebanded static component on the medium of travel that the RF takes and sends it straight to ground.

It has NOTHING to do with protecting the radio from DC building up on the antenna.

.nuke it. friy it or any way you want to say it
>
> dc and other wide band noise should be toataly filterd
> out.

O.K., by what?

How do you filter DC, Einstein?

>
> if you hear noise at other frequecys then the radio is under
> filterd and otherwise junk git a good radio

Not necessarily.

You could be hearing images, injection noise, phase noise from the PLL, etc. Their are many reasons to hear noise.

And their are many radios that vary in their ability to reject adjacent frequency interference.

I doubt that anything you own would touch my Kenwood with the Collins filter in it, though.

let me know when you are ready to step up to a good radio.

>
> If the noise is in the pass band then the noise can only be
> stoped at the place generating it.

Duh.

Static is not filtered out in the IF sections of a receiver.

Sorry, but you have absolutely no idea what you are talking about.

Source record: 4111

The center lead and the sheild are DC connected on a wilson.

The center lead and the shield are not connected on the Penetrator.

The Penetrator is designed to work as a different type of antenna.

He gets more noise because of the additional surface area on the Penetrator
and the fact that static is not bled off the antenna before it hits the
feedline.

many people do not even Know what a collinear is

a collinear is a 1/4 wave below a 1/2 wave with
a 1/2 wave matching stub so the 1/4 wave and
the 1/2 wave are in phase you can play with
the matching stub to rase and lower the mane
lobe

Yadda, yadda, yadda...

If you want a horizontally polarized signal then you should use a vertical antenna, right? Even if you are in the mobile?

You ass. If you want a horizontal signal, use the antenna that produces it!

Line radiation would have VERY little to do with it in a mobile situation. The majority of the line is INSIDE the vehicle, which serves to shield any incidental radiation from the outside of the feedline.

It would NOT have an effect (or a very pronouncable one) at 27 megs in a mobile.

Your fishing, or spewing something that you don't know anything about!

>

2.
> >
> the beam was on a tower and not in the mane loab

Do you mean "Main Lobe", or do you mean "Main Lab"?

Labs mean shit to me. I deal in real world tests.

The main lobe of the quarterwave antenna would most certainly be in the path of that beam at the distance we tested at. 27 megs is not a "ground hugging" area of radio spectrum.

Sorry, once again, your arguments are totally wrong.

>
> the 1/4 wave has a tighter pateren which was going under the beam

Bullshit.

> the shorter antennas have a wider mane lobe so more rf reached the
> beam that was higher than they wer

Bullshit.

The coil on the antennas serves to concentrate more RF energy at a pronounced area, and also serves to propogate the signal in the H plane more than it does in the E plane.

This has been mathematically proven, proven in real world tests, proven on a NEC based modeling program AND PROVEN AT THE WILSON ANTENNA RANGE IN ST GEORGE UTAH! I lived down the street from the test range. Interesting place, and I did learn a lot by watching what they did.

You could learn TREMENDOUS amounts by shutting your damn mouth and listening to what people on this newsgroup said!

>
> not to point out that a horisontal beam can not hear a vertical antenna

No, that is not true.

On average a vertically polarized signal will be close to 20 dB lower when received by a horizontal antenna.

Since the double coiled antenna was heard better than the whip, that would tend to back up my statements and prove you a dumb ass.

Both of the above are true. And the statement about the polarization shift is basic textbook knowledge.

> if you want to make a test rotat the beam to vertical polarization

Why? I don't deal in verticle polarization. I talk DX, and DX is better (usually) when you are horizontally polarized!

> >>
> >> and the shorter the antenna the wider the mane lobe

You keep talking about this. I agree, but you, the dummy that you are, can't seem to get it through your head that on a mobile, at 10 miles or more, it doesn't make that much of a difference!

Not in the difference between a 5 foot and 102" antenna! The lower static noise level on a DC grounded antenna would actually tend to cancel out the effect of the "mane loab" as you so eloquently put it!

> >
> >You mean the shorter the radiator, the less concentrated the main lobe will

> >be... Semantics, but you can take your words and construe them to be
> >whatever you want them to be.
> >
> if you look at a field pateren a 1/4 wave will generate a omni

Any monopole or its derivatives will be omnidirectional in the E plane.

> the shorter the antenna the wider the omni and less peak field strength

Not so. The shorter the antenna, the -3dB points change.

I can argue the same point you are..... If you are looking to have the maximum signal at 45 degrees from the feedpoint, then a 1/4 wave monopole would suck!

So, before you go spouting off what you read in Lou Franklin's books, I would go reread them, and gain a little better understanding of the fundementals of RF propogation!

> >> ther is not any magical antenna that will git you grate gane

> >
> >The lobe pattern would suck at HAAT!
> many people do not even Know what a collinear is

I don't care what many people know.

I know what a colinear antenna is, and you gave a book example. A colinear antenna does not have to have 3 quarter wave sections, it can have as many sections as you want, and they do not have to be stacked vertically, either!

I guess you read that in the latest issue of QST or something, right? Big word, thought you would throw it out their and impress someone that you know what a "colinear array" is?

Big deal. The people at Solarcon also figured out what a colinear array was, and their antennas SUCK!

NNNNNNNNOOOOOOOOOOO!!!!!!!!!!!!

just fancier that way thay sell more for higher price
some of the dual coils i have seen have
the loading coil to close to the base
only about 3 to 4 inches they are as
close to base loaded whips as you can git
and still be called a center loaded whip
try a antenna with the coil at lest half way
up the whip
having large coils will not make it good
they are mostly loading coil and
very litle antenna

>
>Thanks.
>
>-Skorzy

i can not help it BUT they DO
the weaker stations on the base loaded are above the engine
noise a certain db amount

on the center loaded or even a top loaded antenna the engine
noise will be higher becuse of the higher antenna efficiency
but the station will still be the same db above the noise

be careful with wording loaded moble antennas have no
positive gain but negaitive gain
what ever antenna gits closer to the standerd 1/4 wave
it is beter to use efficiency as compared to a 1/4 wave

radiated signal is higher the closer to the feed point
if you take a 8 foot whip and cut it up if 1 foot long chunks
hear is the toatal percent out put as compared to a 1/4 wave
whip
#8 1%
#7 2%
#6 3%
#5 8%
#4 18%
#3 20%
#2 23%
#1 25%
feed point

a base loaded three foot whip has only the top
three feet so it is only 6 to 8% efficiency
it is a tad higher that speck becuse the swr
produced a current node at the antenna
wich shuves a litle more in

center loaded two foot whip hase one
foot of botom and one foot off top so
it is about 25 to 28% efficient becuse of
the current noad

the higher the loading coil the higher the efficiency

some base loaded antennas have a matching network
at the base wich shuves about 40 to 50% of the power
into the whip but the receive is still about 6%
even less now becuse of the loss in the network

and the center loaded whip is still 25% efficiency
on receive

spend the time trying to solve the engine noise
and less on ways to git out of it

ex the spelling

forgot to state somthing just in case you missunderstud

>on the center loaded or even a top loaded antenna the engine
>noise will be higher becuse of the higher antenna efficiency
>but the station will still be the same db above the noise
>whip

that means that the station will still be perfictly readable
with the center loaded as compared to the base loaded

the noise will go up but the signal will go up the same amount

>#8 1%
>#7 2%
>#6 3%
>#5 8%
>#4 18%
>#3 20%
>#2 23%
>#1 25%
>feed point

the figurs are from memory which is rusty
i can do the formlias and the vecter calcs if you
whant but that mite take a bit i just remeber that
obout 80% to 85% is radiated from the botom
half of the antenna

ex the spelling

What you quoted here means nothing in the context
of our discussion.

A tuned-up AM-only radio will develop much more
energy in it's sidebands as will a tuned-up AM/SSB
radio. If you're anything of a CB tech you know
this. The reason why is that AM-only radios mod-
ulate the RF driver and final collector current
through the primary of the audio output transformer.
The transformer winding adds an autotransformer
effect that can't be had using a transistor-based
modulator like the SSB radios use.

Hello

A new software shareware of count of Qth locator under Windows98 (version
32bits).
The software permits the count has the aide of Qth locator or some
geographical coordinates the position of a
station. He gives like results: the distance, the azimuth of the antenna,
the geographical coordinates, the QTH Qth locator, the country, the city.
One could see on a geographical map, the position
of the station with possibility of zoom. He possesses a data base also with
all
the capitals, and country of our old planet as well as the prefixes of the
radios amateurs (possibility
of modifying this data base)
You could see the software and download the version shareware has the
following address:
http://f1usc.click2site.com/

To soon

I don't agree. One board is as good as another regardless
of what model radio it ends up in. The specs didn't vary.

> *You*
> probably were one of those people who said "Cobra HAS to be better than Radio
> Shack."

Again, you're wrong. I make qualitative judgements based
on the chassis rather than the model. To me, the 139 and
the 449 are the same. The reasons why one may sound better
than another are not related to the brand or purposely varying
the quality of the board because it will end up in one model
or another. That's the stuff myths are made of. The reason
yours sounded better, if that trully was the case, was because
of tuning differences and accessory (microphone, amplifier, etc.)
differences.

4129. Cobra 148GTL case needed.

Newsgroup: rec.radio.cb
Date: 1999-09-28 00:00:00 UTC
From: Ben Olson <dedcow@nwlink.com>
Message-ID: <37F07CF9.B2603F77@nwlink.com>
Source record: 4158

hello 11meter fans, i am looking for a case for an older Cobra 148GTL, mine has been drilled on both sides for diffrent mounts, and i would really like to restore it to a good look again. anybody have a dead 148 they can scrap the case skins off or know where i can get a set? thanks!

So, what? It has no advantage over the
simpler techniques used by CBers today.
You'll eventually realize that.

> If you have tried the technique
> and been unsuccessful in realizing any true
> advantages or results, have you ever entertained
> the possibility that maybe you were doing
> something wrong?

As applied to high-performance CB, SCAM
has no advantages--you're just not advanced
enough to know that yet.

> Or is it because you already
> "know it all", and this is what is preventing
> you from understanding it any further?

From what I've read of yours, I'm alot
less a "know-it-all" than you are.

> You both need to learn how to relax.

And you need to learn how to open your mind
to concepts that are not in the ARRL Handbook.
You also need to learn how to prove or disprove
what others say through personal experiment
rather than by posting inapplicable quotes
from old textbooks.

> "You Don't Know Jack"!

I'm certainly glad of that.

Besides, if you've seen one closed-minded,
mediocre tech you've seen them all.

If you're looking for a true, powered, peak-reading meter, the SX
series isn't it. In the same genre, the Mirage MP-1 is a powered
peak-reader that covers the HF range.

Set the AM dead-key to 2 watts (VR10 adjusts it).

> Should I have it peaked by the local shop or leave the power stock with
> the mod limiter in tact?

If you have a decent wattmeter you should be able to set it
up satisfactorily yourself. You have to trust in your own
ability. If you don't feel good about doing the work your-
self, have the shop do it.

There's not much you have to do on that radio to tune it
up and set it to run an amp. You don't need to remove
the limiting device itself, just adjusting the pots will
do. Set VR5 for max modulated power on AM; set VR6 for
max power on SSB; tune L26 for max modulated power with
radio set to channel 19; set VR10 for a 2 watt AM dead-key
with no modulation. That's all there is to it.

> The amp and antenna setup that I will be using
> with the Uniden is a Silver Eagle 200 and an X-terminator II.

The Silver Eagle 200 is an economy model amp that doesn't
like seeing alot of dead-key power on AM. Make sure to
limit the dead-key to 2 watts if you're going to run it
on high. It's an unbiased amp (technically Class C) so
don't worry if it sounds somewhat distorted on SSB. If
you can, only use it to initiate a SSB contact then turn
it off if you think you can maintain the contact. Also,
those amps can be unstable. Check the output SWR (between
the amp and antenna with the meter as close to the amp as
possible) to make sure it's not too high (above 3:1) with
the amp on.

> Thanks

You're welcome. Good luck.

You know the old saying: "You pays your money and you
takes your chances."

Have you ever talked to any old men when they're not
far from passing away? They rarely regret anything
they did. What they regret are the things they
didn't do and the chances (with potential payoffs
in whatever areas) they didn't take. To say you
always played it safe and you never never broke a law
when you're in that situation won't be very comforting.

Bill, re:

>>The fact is that *Uniden* made these radios to various different similar specs and some were better than others.

>I don't agree. One board is as good as another regardless of what model radio it ends up in. The specs didn't vary.

Sure they did. The boards weren't identical. For some reason, Cobra had them stuff other crap in there which screwed up the modulation when you tried to peak it. For that matter, the TRC-458 (base version of the 449) was a crappier version of the 449 or the 139XLR...

>Again, you're wrong. I make qualitative judgements based on the chassis rather than the model. To me, the 139 and the 449 are the same.

Similar, but not identical...

I seriously doubt that the potato would produce enough electricity to run a CB radio. The contraptions that I have seen make use of the potato power are usually LCD clocks.

As far as positive and negative, either nail should work for either polarity.

Well let me tell you up here in central MA it's going to
drive the locals absolutely NUTS! Channel 2 is "their"
place, and they are a weird mix of drunks, elderly, and
teenagers who all answer to and worship a lady with a
voice like a foghorn named "Mama Sweet."

She's the only one who has a linear and wait until she
hears this keydown and tries to lecture "those bad little
boys."

Oh, and add-on extra. That's different. Yea, and you can also add a
speech compressor too, as an add-on.

Any radio can do PL tones, with the addition of a PL encoder board, such
as a Com-Spec unit.

> lead to arguments.

Two things. First, I've seen more of my share of bad 2950's. That being
said, most of the problems with the 2950 revolve around cold solder

joints on the chassis mount regulators.

I run a 2950 in my truck. I've had it for 7 or 8 years now. I've taken care of the solder joint problems, and other than that, the rig has performed flawlessly. It does have a poor noise blanker, and the adjacent channel rejection is less than some other radios like a Uniden Grant. But I rarely find myself in a situation where bleedover is a problem.

>

> I think the 2510 and it's clones are crude
> radios. They especially suck when it comes to
> AM modulation.

I find the audio of the 2510 to be just fine. You just have to keep the carrier level to less than 15 watts, and you'll be ok. On the scope, you cannot tell the difference between the 2510's low level modulation, and that of another radio with high level modulation.

The one thing that you do have to be careful of with a 2510 (and the President Jackson, which has virtually the same transmitter) is the power control circuit. The power control derives it's feedback from an SWR sensing diode, which allows the transmitter to back down the power when the SWR gets high, thereby saving the final. But an unpleasent side effect of this circuit is that under certain conditions, (such as the input matching of a amplifier) the feedback can be greatly reduced which results in the rig putting out too much power. This can cause overdrive of the amplifier, and the distorted sound you get when you have no forward swing and all back swing.

Here's some news: The new RCI radios should be here before XMAS. The
RCI-2990DX will be reviewd in the upcomming NOVEMBER issue of Popular
Communications. It's main diference from the original 2990 is that it Receives
24-31.999 rite out of the box, and XMITS on the 10 & 12 meter ham bands (I'm
sure there will be a "mod" to make the 11M recieve only portion also XMIT!).
There will also be the 2950DX 10&12M similar "dual bander", and a 2970DX too!
Thats all for now.....John

Thanks to all who have responded. I have chosen the PC-122XL because I want SSB and a front microphone jack. The only other Uniden would be the Grant LT and it is almost twice as much money.

I haven't decided on an antenna yet. I have a Dodge Caravan that I will be installing the CB in and would not like to drill any holes in it for the antenna.

I am thinking about one of the Wilson magnetic mounts or maybe the thru glass mount from Solarcon.

Any idea which would be better?

Duane

Hello & Good afternoon,
Go with the Wilson mag mounts, the through the glass
types are as worthless as RFENFORCER & Hooligan is,
absolutely useless. But all useless things aside, the
through the glass antennas are only good for about
one to two miles. The Wilson mag mount will give
you far superior performance.

I am fairly new to CB and I have many questions about CBs in general, the answers to which are probably already on some FAQ site or site about CBs in general. Is there a site that could tell me the basics about CBs, SWR, best type, position of antennas, what kind of coax is used, cheap mailorder places to buy basic equiptment from, etc.

So please, if you have some sites that you like, about CB's or companies that sell basic cheap CB equiptment like plugs and antennas, etc., please respond. Thanks so much!

Message-ID: <7sr69l$e5m$1@ins21.netins.net>
Source record: 4191

I was just wondering if all the models of Texas Star Amps have a separate switch for SSB ?

Also when using SSB is there a Delay on the receive like the Palomar 225's have ? What I am trying to say is that on the 225's when on SSB there is a delay from when you unkey the mike until you can hear the person talking back to you. I always happen to miss the first sentence or so because of this delay.

I was wondering if the Texas Stars have the delay problem also or if the delay is caused by the auto SSB on the 225's.
Thanks Again,
Tinker

That delay is caused by the transmit delay in the amp. You need some relay delay to avoid dropout during those periods between words while you are transmitting. If you are missing some receive time the RC/RL time constant on the delay circuit is too long.

A friend had one of these some time ago and it performed well for him.
Yes they are rugged and compared to the Wilsons, cheap. If the antenna
is worn out and you have to replace, yes, try to find a Wilson at a good
price. Just to replace it for an improvement in performance? I don't
think there would be that much difference to warrant a swap.

: Most mics will not work with it, Any help will be Greatly appreciated.

There are at least a couple of people who sell all sorts of radio and test equipment manuals. Unfortunately, I do not recall their names or e-mail addresses. It may be possible to find out by doing a search on deja news - looking for "manuals". You should only get a few tens of thousands hits.

There is nothing magical about preamplified microphones. The hardest part is getting the wiring correct. One caution - if the Motorola was preamped, then it might have derived its power from the radio, rather than from a battery in the mike. If that is the case, then you would want to remove that voltage before hooking up a battery powered mike.

Such a setup is only necessary when you are using rf driven switching of the amplifier. It is the cheap and simple way to do it, as no modification of the CB radio is needed.

Far better is a dedicated switching circuit. Key the mike and the amp keys with the radio. Pause while talking, and the amp stays keyed up. Unkey the mike and the amp immediately unkeys.

I would not run a linear any other way.

i can't say that your friend was wrong about the mic pre-amp and i could be
wrong here but i do know that on a lot of the non-mainstream cb's, they used
crystal mics which would make a dynamic mic from most other radios useless if
this is the case with yours.
non-mainstream doesn't nessessarlly mean a bad thing.
what i meant was that some radios out there wern't cloned much like the
johnsons and motorolas and were not very generic in their parts choices.
just something to check
good luck
jeff

check the supply voltage / regulator circuit to the PLL.
check the same for the voltage to the varactor to the VCO also.
another thing, who ever opened up the slider for 20 khz, may be over loading
the varactor circuit and other associated circuitry there. GENERALLY speaking,
you don't want too much more than 8 or 9 VDC on the varactor diode.
good luck

Hi,
I have an EARLY (PRE-Uniden) Cobra 148GTL for sale. Peaked and tweaked, covers 26.785-28.045, with a 40KHz slider. I don't need the radio anymore.

$100 or best offer. Cash only, no trades please. Buyer to payer shipping, and insurance if he/she wants it. Respond direct via e-mail, not to the group, please.

Thanks,
Bob

hi bill. with all the mods you guys discuss here you would think that you new about the chipswitch. take a look at the other cpu available for the 2510. ive ran a few of them and found them to be fantastic performers with tons of more features than any 2950.

Tinker,

Good questions.
>> I was just wondering what class works best with A.M. and SSB . Or if all of
>> them will work but some may sound better than others.
>> Sorry for too such of a broad question.
>> Tinker
Just my thoughts on SSB FWIW. I hope Bill won't disagree:-)

Bill, drop me an e-mail detailing some of this 'leading-edge' research,
I'm genuinely interested.

How I read what works for me being primarily interested in the very best
possible sounding SSB mobile signal.

Class AB bias is adjusted so that Icq equals approximately 0.5-2.5% of
maximum specified collector current. This translates into 100-500mA per
transistor (2879) or 200-1000mA per pair of devices. This mode yields
acceptable linearity for SSB operation and higher efficiency (40-60%)
than class-A. The Toshiba 2SC2879 data sheet specifies a minimum Icq of
100mA per transistor for class-AB operation. I have found that by
increasing Icq to 500mA per transistor results in increased linearity
and lower IMD and harmonics.

People on air have asked how my amp (homebrew 8-pill) sounds so good as
compared to factory ham band amp's, Metron, Henry, SGC, Ten Tec Hercules
etc. The higher Icq is the reason.

You may ask why the factories don't increase Icq. Because it costs more
dollars to build a separate high current bias source for each pair of
transistors and even more to produce an amp that will remain stable with
a high Icq. So the factories use the minimum recommended Icq because it
is cheaper and it yields satisfactory results.

Since I've never been satisfied with satisfactory performance my unit
has independent bias adjustment per pair of devices.

Class-B bias is adjusted so that Icq is just equal to the leakage
current (Iceo). the transistor is just barely cut off and any drive
signal causes the collector current to flow. This mode yields acceptable
linearity for some AM applications and higher efficiency (60-70%) than
class-AB.

The Skywalker amp kits are probably not what you're after as they are
designed for 1.8-30MHz operation and are therefor not really optimised
for 11m.

Phil / UK

Bill Eitner:

As to your post relative to the Sweet 16:
What would be the best driver to use for
the 16? Is it possible to drive the
Swt16 with two pills? Are you saying
that the driver should be set to the
same wattage as the radio to see
optimum results? What wattage
should that be? thanks. I've been
reading your posts (as well as posts
in the newsgroup from Toll Free) over
the last month or so and have to
commend you both. You both shed
a lot of light on subjects of interest
to me. If you're ever in NY, let me
know, I'll buy you a beer.

Please keep me in your prayers, I am getting off of these newsgroups & some parts of the internet. (Except news/Weather/Trains) I have mild cerebral palsy & therefor most things that are disability related are of no use for me. So rather then get in to problems I am leaving. I would like to apologize to all of the news groups & there sysop's or who ever is in charge. I seemed to get cussed out on the following groups;

alt.config
rec.radio.cb

I already got off some of them & most of the msn newsgroups have closed & they made them in to web communities. I am sorry but I rather get out because it seems that some people are calling me by voice & then not saying anything. So you all have a great rest of the year & happy 2000! BTW I am also sorry for uploading the sound files & using HTML on the news groups.

Thanks for all the information that I got on these news groups.

Hi folks,

My daughter and her friend ran away yesterday
after school from Prince Edward Island Canada.
They managed to travel hundreds of miles away from
home overnight by hitching a ride with a trucker.
At this moment they are somewhere in the Province
of Quebec, with the trucker, headed west. They
phoned one of their friends at 5 am today so the
exact details are weak.
They should be spending the night at a truckstop
somewhere in Quebec. They have been reported to
the police nationwide but there's alot of highway
out there.
Can anyone give them a yell and tell them to phone
home? Their names are Alisha and Crystal.

Thanks all

Brian Wojtowicz
Prince Edward Island

Would you hear the static if it were outside the passband of the
receiver?

When you state "static" you mean noise generated by the engine, not
static electricty, right?

Pick up a copy of "CQ", "QST", or "73" magazine from the more well stocked newsstands. There are several patches available.

And without discussing the legal ramifications, I would have to ask "WHY"?!?

Forget INTENTIONAL jamming, just think of what the usual ambient background noise is...HOW can you effectively communicate with THAT cacauphony going on (unless you are only going to call another radio op who's used to it and can pick you out of the QRM)

Just wondering.

Steve

The dx-100 has has a pair of 1625's tubes for the push- pull audio. I hear alot of am-only hams running the dx-100 on 3.882 +/- Mhz. I picked one up at a hamfest for 50 bucks! It's my loudest radio.(2). buddy tx-11b.(3).browning mk.1 with 6L6 replacing the 6BQ5 and a 2E26 replacing the 5763. (4.) Tram titan. (5.) Sonar fs-23. These are radios I have, and I'm preferential to tube sets. There are alot of solid state rigs that kick a-- too.

Phone Patches are not Illegal on CB Band as long as they are manually controlled. You have to be at the controlling site to initiate the call and to switch back and forth from the radio operator and the phone line.

> Hmm.... I've never noticed any problem with positive modulation from a
> 2510.

Then you've never really compared it to a high-level AM
radio on a scope. The difference is plain as day. It
would be even more plain if you could look at it using
the trapezoidal method. The drawback is you need a decent
audio signal to do it that way. Low level AM doesn't lend
itself to that method.

> The radio's amplifier is capable of producing between 40 and 50
> watts peak power on SSB (after tuneup), and would produce the same
> carrier level, if the carrier were set to full on.

That doesn't mean a thing. It's the ability to fully
modulate the carrier is what we're talking about. There

may be enough audio to fully modulate the carrier way
back at the TX mixer, but when put through a bunch of
linear amp stages the positive modulation percentage
noticeably decreases. Think about it. If that wasn't
the case, why would anybody use the more expensive
high-level technique?

> With this in mind,
> peak AM modulation should also fall in the 40 to 50 watt range, which
> should allow 100% modulation of a 10 watt carrier.

That's absolutely untrue. There's no connection between
SSB peak and AM peak in a low-level AM radio. For example,
my Jackson peaks lower on AM than my 2950, but it peaks
higher than my 2950 on SSB.

> My testing on my own
> 2510 seems to bear this out, as I have no problem getting 100% (4X) peak
> power with a 10 watt carrier.

Then you should check your test set-up. You may be seeing
what you expect rather than what is really there. Remember
to limit your test to 100% NEGATIVE modulation. In other
words, set the carrier level, then inject a steady 1kHz
tone and ramp it up just to the point of 100% NEGATIVE
modulation. (I'm assuming you know how to do that.) At that
point, measure the percentage of POSITIVE modulation. If the
carrier is higher than 4 or 5 watts, the positive modulation
will be below 100% even though the negative modulation is at
100%. That's the problem with low-level AM radios. It gets
worse as you ramp up the carrier (dead-key) power.

> The modulation envelope is "normal" at
> this level.

No it's not. You're fooling yourself.

> Lower carrier levels of 4 or 5 watts, gives an even more
> peak power ratio if the limiter is not set to hold at 100%.

We're not talking about unlimited modulation. We're talking
about ratios within the 100% boundary. Another easy
check is to verify average power. Given what you've
said, the 2510 should be able to hold an average wattage
of just under 15. That couldn't be more false. Set the
dead key wattage to 15 and then modulate the carrier
while monitoring the average power using a Bird. The
power reading will decrease with modulation no matter what.
That indicates an average power that is less than the dead-key
power.

> Generally speaking, most radios will lower total peak power, when
> carrier is dropped, unless a "swing" type mod is employed to bypass the

> AC modulation component (the capacitor) around the resistor that lowers
> the carrier level.

That all sounds nice, but let's stay on track here.

In every AM performance parameter we can think of, the
2950 will easily outperform the 2510. That's what this
is all about.

> >
> > On the other hand, the 2510 will show higher peak

> will easily top that by at least 10 watts (and with a single final).

It's not by "at least 10 watts." It's more like 5. On the
other hand, the 2950 beats the 2510 on AM by 5 peak watts and
more when maximum peak to carrier ratio is considered. Don't
get carried away.

First, Toll Free doesn't agree. I tend to believe Toll over you.
I've stared at 2510 schematics for hours trying to figure out bizarre
problems. I've never noticed the circuit you speak of either.
You're going to have to lay out some part numbers and circuit
analysis to convince me.

> >> Tinker
> Just my thoughts on SSB FWIW. I hope Bill won't disagree:-)

I do disagree with much of what you've written.

See below for details.

> Bill, drop me an e-mail detailing some of this 'leading-edge' research,
> I'm genuinely interested.

Forget the e-mail. I'm going to roast you here just like
you tried to roast me. Grab as much of the leading edge
stuff as you can.

> How I read what works for me being primarily interested in the very best
> possible sounding SSB mobile signal.

Forget what you've read. Test the leading edge research
rather than passing it off so quickly.

> Class AB bias is adjusted so that Icq equals approximately 0.5-2.5% of
> maximum specified collector current. This translates into 100-500mA per

> than class-A. The Toshiba 2SC2879 data sheet specifies a minimum Icq of
> 100mA per transistor for class-AB operation. I have found that by
> increasing Icq to 500mA per transistor results in increased linearity
> and lower IMD and harmonics.

The trick is to forget test equipment based specs and go
by what your monitor (you have a monitor don't you) says.

> People on air have asked how my amp (homebrew 8-pill) sounds so good as
> compared to factory ham band amp's, Metron, Henry, SGC, Ten Tec Hercules
> etc. The higher Icq is the reason.

That's all useless anecdotal evidence. If you're going to
roast me, I'm going to call you a liar to your face. You
couldn't be more wrong by acknowledging quiescent collector

current as the reason why your system gets good reports.

> You may ask why the factories don't increase Icq. Because it costs more
> dollars to build a separate high current bias source for each pair of
> transistors and even more to produce an amp that will remain stable with
> a high Icq. So the factories use the minimum recommended Icq because it
> is cheaper and it yields satisfactory results.

It's more than that. The amps actually work better with
less bias. Class B lives even though you don't recognize
it, believe in it, or understand it.

> Since I've never been satisfied with satisfactory performance my unit
> has independent bias adjustment per pair of devices.

What the fuck does that mean? Re-read that with the
understanding that you didn't write it. I hate to say
it, but you lost it right here. Nobody cares about your
amp when you're debating me. We're dealing with concepts
here, not how your personal amp responds.

> Class-B bias is adjusted so that Icq is just equal to the leakage
> current (Iceo). the transistor is just barely cut off and any drive
> signal causes the collector current to flow. This mode yields acceptable
> linearity for some AM applications and higher efficiency (60-70%) than
> class-AB.

This type of operation IS the leading edge. Class B has
all the benefits and no disadvantages. Forget your biases
and go with it.

> The Skywalker amp kits are probably not what you're after as they are
> designed for 1.8-30MHz operation and are therefor not really optimised
> for 11m.

27 MHz is in the 1.8 to 30 MHz range--isn't it?

You're not an idiot. Bias your amp just to the point where
there's no audible distortion on SSB. THAT is Class B bias
and one leading edge facet of amplifier development. Store
this one comment as a research based golden nugget.

Second time sending out. Don't know where it went...
Date:
Fri, 24 Sep 1999 17:03:30 -0700

I am looking for any other mod's on these radios. On the two Cobra's
there is the same PLL, the LC7185-8750... There is no mod for that chip,

but I am wondering if I could swap that one out with a different one?

On the HandHeld I am mainly looking for channel mod's...

The Euro, I have some-what peaked it, tho I am suppose to get 15 watts
am, and I am only getting about 8 watts.

I am looking for power mod's and channel mod's.

Any help would be greatly appreciated...

Thanks,

BlackCat

National NC-46 Receiver, Excellent condition inside, Repainted cabinet is so..so,
with manual $100.00 Obo plus shipping

SBE 6 tube linear base amplifier, uses six 6LQ6 tubes, 15-80 meters
Easy 600 watts peak output $250.00 plus shipping SOLD

Electrovoice Slim crystal desk Mic with EV Base $75.00

Shure 522 Dynamic desk mic. Like new $60.00

Cobra 148 GTL ,Astatic 575M6 amplified hand mic
extra freqs, Modulator dial a watt $150.00 SOLD

Tram Diamond 60, 23 channel mobile CB, $50.00

SBE Sidebander II, 23 channel mobile CB with stock mic $30.00 SOLD

Johnson Viking Mdl 1 AM/CW transmitter, plate modulated 6146's
good condition with manual $150.00 plus shipping, pick up in So. Cal.

Siltronics Mdl 90 VFO, -6 model, very good condition $60.00 Plus shipping

Siltronics, 1011C transceiver with manual, missing output tube, receives $90.00 Plus shipping

Yaesu FT101EE, great condition, original NEC tubes working to full output,
Stock mic, AC/DC cord, Manual $320.00 Plus shipping SOLD

Gonset GSB-101 amplifier, Uses three 811 tubes, Clean condition,
with manual $225.00 Pick up in SO. Cal

Home Brew 10 meter amplifier, Uses three 24 volt version of the 6146 tube, Made from a military PA deck, Homebrew supply, open chassis construction, RF sensing, Meter, Bias adjust, plate/load controls etc. $100.00 Plus shipping

Amplifier, 10 meter, General Linear System PA deck using two 6LQ6s driving one 3-500Z, This is a 2 Peice amplifier mounted in what looks like a 3 drawer night stand, I call it the "Furniture Amplifier" Very unique $350.00 Pick up in So. Cal.

Tram D201, Good condition, Great AM, weak SSB, Maybe a tube, Manual $200.00

McCormick Commercial mobile radio, programmed with 16 packet frequencies, 40 watts output, great receiveand TX $75.00.00 plus shipping

6LQ6 Pulls, good output $30.00 Each ALL SOLD

Abandoned Browning MKIII project, 2 receivers, 2 transmitters, One receiver works great, the other fair, New Nuvistors in both receivers, was in the process of making one good transmitter from the two, One transmitter missing knobs and the eagle. SAMs Service Manual, Pick up in So. Ca. area $300.00

All Items shipped upon receipt of MO, Personal checks will need to clear before shippment. References available, Delivered UPS ground or Priority mail.

Alright I own a Galaxy 77hml and I have a Palomar 225 with a 6 ft
fiberglass whip
i know the Palomar isn't the greatest but i got it cheap so i bought it
now i have a couple question's because i'm having some problem's with
it. First because of the Galaxy being a 10 meter radio does this affect
the amp? Second of all should I be using some kind of antenna other then
your basic whip? and now my problem's god you guy's are gonna hate me
cause i'm kinda stupid when it come's to this cb stuff but i learn as i
go on
alright i'm running that like i told you and the Galaxy 77hml has a hi
med low setting and i use the lo for the amp which has been tuned to
like 5 watt's i believe and i use the high for when i'm talkin
barefoot. Well the other day i keyed up on hi power on the radio and
the amp was running and instead of the amp blowin or anything the hi
power on the radio is messed up in crackles now so i have to use med
power when running barefoot. I think this might be because of a bad
match i'm not sure though and if you guy's could help me out i would
aprectiate it greatly thank you

I'm not so sure the coax in a glass jar is a complete hoax. A couple of weeks ago I was at a neighbors house when a thunderstorm came thru. We were on his front porch and I saw lightning hit my tower. I had my coax in a glass jar and that is the only reason I can think of why my radio equip wasn't toasted. If you think about it it's kinda logical. Lightning will normally take the shortest path to ground. If the coax is attached to the radio then there is a path to ground thru antenna to coax to radio then out thru the power cord. If the coax is in a glass jar there is no path to ground thru the coax reducing the likelyhood of lightning coming in thru the coax cable. Instead, assuming the tower is well grounded, the lightning will tend to run down the tower instead.

Tuning L38 doesn't really do much for PEP on my Grant XL. While it does increase deadkey about a watt, the max swing barely increases. I'm wondering if my tuning procedure is off. I've removed R131 and TR24 and adjusted VR10 for about 5 watts deadkey (though it can go up to 8). Currently swings to about 16. After tinkering with L38, it can go to 6 watts deadkey (9 max) and swings to about 17, though I re-adjusted VR10 back down to 5...

>Band service.

you pick up on things really well. please explain this principle to the RF sheriff and his deputys.

> I too am a CBer. I have as much right and entitlement to those airwaves
>as you or anyother citizen. And I have a reasonable right to expect that my
>"rights", such that they are, will be protected there too.

i agree 110% here too. if your rights are being violated on the cb band, do what we do. GET A BIGGER AMP! this is the only protection that we get, short of vigalanti-ism.

> As for the Ham who was looking to put his rig on the FRS freq's, all I can
>say is there's a loon on every lake. I personally would rather find a way to
>put some of those nifty rigs on 440MHz rather than put my 440MHz rig on FRS.
>One of the Rat Shack rigs is really a well engineered piece of gear, and for
>less than $100 bucks, would make a nice low-cost alternative to YaKenComCo
>rigs
>out there now.
>
>

once again, i agree 110% but everytime we want to put one of those "nifty" 2510's, 2950's, galaxy's, etc..., on 11 meters, hams start shittin' red bricks,(tan sand ones here in fla.), and most of us don't even go into the ham bands with them.

>
>>there's dirt on both sides of the fence but the RF police hams are always
>pointing at our pile while ignoring the heap behind them.<
>
> Sorry, only partially true, and I imagine a manifestation of some
>paranoia
>on your part. Hams have been very aggressive in keeping our own stalls as
>clean as possible. The current enforcement actions are the net result of
>that.

the fact that it's only partly true is the problem. untill you compleatly clean your yard, don't bitch about mine because your side of the fence smells as bad as mine.
paranoia on my part???
try this experiment for 1 month and let me know the results.
change your screen name and id'er and start asking questions about radio mods and amps and look at the id's of the RF police who jump down your throat. be very general and don't let on that you are a ham.
don't use the term cb, use 11 meters. some of the RF police will help you, assuming that you mean cb, when you could be refering to the out-bands. other times the RF police will fire on you as soon as they see your hat, not knowing if you are a ham asking for a LEGAL 10 meter mod or if you are someone in another country where these freqs ARE legal.
not all countries belong to the ITU but the RF police are so self-centered as to believe that this is their own little U S A only web board and can run off anyone that they believe is breaking the law when the have no authority to do so in the first place.

>If the really serious 11 meter ops were to make a
>concerted effort to clean this trash up, and quit flaunting the law with
>megawatt keydowns and blatant violation of other regulations, thre wouldn't
>BE
>any effort to pass this torch on to local law enforcement, but that's not the
>reality of the situation.
>
>

this the point that i've been trying to make for 6 months now.
WE KNOW THAT WE DON'T HAVE THE AUTHORITY, MORAL OR ORHERWISE, TO CONTROL OTHER PEOPLES ACTIVITIES!!! WE ARE NOT THAT ARROGANT. IF THE GUY IS HOLDING A GUN INSTEAD OF A MIC, THE STORY CHANGES.
IF THEY WANT TO OPERATE THAT WAY AND GET CAUGHT, SO BE IT. I WILL STEP BACK AND WATCH AND KEEP MY MOUTH SHUT.
i hope that i've made my "one thing" position clear.

>

>Now what is the big deal about putting the Ham's down? "Most" ham operaters
>on the
>proper equimpent, as we know there are some that don't. FCC mostly takes care
>of
>them.
the big deal about putting the hams down, specifically the RF police, is the
fact that they could devote more of THEIR energy on THEIR side of the fence.
i mostly keep my opinions about the channel masters and their keydowns to
myself. i agree in principle with the idea of experimentation but not with the
practice of driving something akin to a carnival generator truck for daily dx
comms.
i thought i was in the majority or at least the average group who takes pride
in running a clean radio at only 200 or 300 watts mostly on the out-bands and
only with the power that i need to sustain comms. gee, that almost sounds like
the ham credo, doesn't it? i guess mine is kinda like a common-law radio
system, i'm not bound by a piece of paper but the radio still puts out. (i had
it's tubes tied.) :):):)
i have to give the big radios credit for one thing,
other senerios have been posted with a bunch of what if's and maybe's so here's
mine:
WHAT IF the local arc hq and repeater sites in a very rural community were
destroyed by a storm along with all the other ham towers, cell towers, phone
wires / microwave installations, cb antennas, power lines, ect...
now all these boys bring out those big portable broadcast stations that they
keep in hiding and set up a comm link to the outside world in order to save
life and limb of the community.
under fcc rules, there are NO illegal freqs or equipment when it comes to
endangered life or property EMERGENCYS.
i would bet the hams would be more than happy to use this equip. if it meant
saving their skins and they could probably be able to rebuild their club house
when they shit all of their collective bricks when the fcc doesn't penalize the
opps that were running 50 kw on the out-bands or cb.
NOW, I KNOW THIS IS AN OUTRAGIOUS EXAMPLE BUT, you can't say none of this CAN'T
happen. there is a better chance of this happening than some of the nuclear
examples that i've see here. i agree with the nuke thing but politically
speaking, the weather carries more hazzard on a larger scale than the nuke
threat on a day to day basis.
oh wellllllllllll

>

i'm sure this is true and agree with you but the key words here are as follows:
>If you read the ham NG and/or QST,

it was posted here once and there was no outcry for a lynching on THIS ng by
any hams like there is for some schmuck who wants some more channels or more
power.

>Hams have plenty to say about those who break the regulations

boy, that's an understatement!!!

even if it doesn't concern you.
but i propose a 1/2 way meeting point between hams and 11 meter ops.
agreeing to the fact that hams have as much right as anyone to be here and on
cb.
if hams have something negative to say about the way that we want to "repair"
our radios, why don't you just click on the box that says "new message" instead
of posting spam-like responses directly to the question?
if someone "attacks" a ham or the ham community in a posting, THEN jump in and
defend yourselves. no one would expect anything less.
but if a guy asks which pins to ground on an 8719, don't come back with all the
legal bullshit. it makes the ham community sound foolish like if someone asks:
Q) what color is an orange?
A) aluminum!
there is no ELECTRONIC OR TECHNICAL connection between pins 9 an 10 of an 8719
PLL and part 95 of the fcc rules. only in the minds of the RF police does this
connection exist.
please don't answer a question that wasn't asked,
POST IT AS A NEW MESSAGE INSTEAD!!!
DEAL???
I HOPE SO. SO MUCH OF THIS DIALOG BATTLE COULD BE SAVED FOR COMMON ENIMIES LIKE
THE REAL RF COPS PROPOSED IN CONGRESS.

first of all, I would like to thank you all for helping me choose the Grant XL. Thanks to all who helped me.

Ive got a couple of questions about the Grant......

1. If I decide to get the power modified, what is the acceptable range for a long life of the radio.

2. what mods should I NOT do? I hear good and bad things about clipping the Modulation limiters. What is your opinion?

Thanks again and happy CB'ing

Cliff

The palomar 225 and 350 both are not designed to take a deadkey of over 2-3 watts. I would have you dead keyed turned down to 2 watts or even less to get the best performance out of your 225.

Just curious. How do these new 100 watt internal amps dissipate the heat the generate? I know most radios design for 100 watts have heat sinks integrated into the chassis and fan to assist the cooling. How do they overcome this problem?

This is not a troll but would really like to know. I have a radio that I might be interested in using one with, if they don't over heat the components in the radio.

Look at the schematic again! You'll notice a diode that rectifies
reflected RF power, and sends this negative voltage to the AM power
adjustment pot. When more reflected power is present, the negative
feedback increases and the power falls off proportionally. If that isn't
a protection feature, then I don't know what is.

Hmm.... I've never noticed any problem with positive modulation from a
2510. The radio's amplifier is capable of producing between 40 and 50

watts peak power on SSB (after tuneup), and would produce the same carrier level, if the carrier were set to full on. With this in mind, peak AM modulation should also fall in the 40 to 50 watt range, which should allow 100% modulation of a 10 watt carrier. My testing on my own 2510 seems to bear this out, as I have no problem getting 100% (4X) peak power with a 10 watt carrier. The modulation envelope is "normal" at this level. Lower carrier levels of 4 or 5 watts, gives an even more peak power ratio if the limiter is not set to hold at 100%.

Generally speaking, most radios will lower total peak power, when carrier is dropped, unless a "swing" type mod is employed to bypass the AC modulation component (the capacitor) around the resistor that lowers the carrier level.

The output of a 2950 on SSB is typically in the 35 watt range. The 2510 will easily top that by at least 10 watts (and with a single final).

>

Yes, Agreed, but what seems to be happening (and I don't have the equipment to verify this) is that you set the output power into a "normal" load, which is usually not a flat 1:1 50 ohm load, but rather, has some small reflective amount, but not enough to be problematic. Then

when you change to the input matching of an amplifier, there is either a better match, or there are reactive components that "fool" the sense diode, and result in less feedback being generated and the power of the radio increases, which results in overdrive. I've wanted to bypass the feedback circuit so that this isn't a problem, but the power adjust relies on negative feedback voltage. Removing this causes the carrier to go full on. I haven't troubled myself enough to design a fixed negative voltage source to utilize, or to explore redesigning the carrier balance circuit. Since I haven't used my 2510 with an amplifier lately, further work in this area, have been back-burnered.

Nor are there any "functions" on front panel to facilitate operation of
a multi-PL encoder, if one were designed to work with this particular
model.

Thanks Tony for your response. Any other info you have about an escort? I'm thinking about a Uniden PC68xlw with a K40 trunk mount. Nothing fancy but your response did cause me pause.

Thanks again.

In my opinion, the modulation limiter cut is one of the worst things you can do to your radio. Yes, the audio will be extremely loud but this will be "dirty" audio, which you'll have problems controlling, and in some cases have people telling you it's too loud. The dirty signal (by dirty, I mean over 100%/distorted waveform-audio) tends to cause extra bleedover problems across the 40ch bandwidth and if you add an amplifier on top of that, it's possible that you'll have more enemies than friends. The best this you could do is run the cleanest sounding station in your area, and you'll be surprised how many compliments you get too. Once again, this was just my 2 cents -
Woody

First off I don't consider the Galaxy a 10 meter radio but thats another thread.
The little amp will work fine on 10,11,12 and beyond so that is not your problem.

Not that i would know anything about this radio......BUT,
you will get the best results from turning the audio pot all the way up and
then back it off a hair. Leave the deadkey of the radio between 2.75 and
3.25 watts and the radio will run for years to come.

If you tighten up the passband of a receiver to the point of where you hear no static, the skirt would be 0Kc and you would have no signal of ANY kind get through!

And, quite possibly, you would still get static, (albeit limited) as it would find it's way from the IF chain into the sensitive audio section and be amplified their.

I agree.

Their is something about Johnson's design.

Heathkit used it in the DX-100. The things that you see on the Heathkit
that you like are duplicated on the Johnson Viking transmitters. The only
real differences is that their are some minor cap variations (actually their
are different RC circuits) in the audio chain to give it a slightly
different tonal quality (I like the DX-100 audio better), and the DX-100
uses 2X6146 for finals, whereas the Johnson has three.

Phil,

Got the tube. Thanks.

The Commander, Pride (Solid State) and Palomar 250 and 300A (Solid State)
all had adjustable bias for each pair of devices.

You could really make one of those amps sing, if you knew what you where
doing. I had many truckers sold on my work just after selling them one of
those amps and tuning it (both the radio to the amp, and the bias to the
drive level) together.

Your right. The higher Iq does make a difference on sideband.

Now, if you would only finish that 3CX3000 mobile! we would be able to hear
you stateside!

hehe

No, not really.

I like the Penetrator, although it cannot take more than about 3Kw (it was originally designed to work with the Messenger Competition 1Kw 16 pill amp). It is a good antenna, with a wide bandwith. It also works wonders as the top section of an Antron!

The Wilson may just be a better all around antenna, if maximum bandwith and such isn't a concern.

Either or...

The noise generated by the engine (picked up by the antenna) would drain off the system just as much as static electricity would.

But, it is usually engine static that makes the problems.

FCC rules Part 95, Subpart D, paragraph 95.420 (CB Rule 20) states:

(a) You may connect your CB station transmitter ot a telephone if
you comply with ALL of the following.
(1) You or someone else must be present at your CB station
and must...
(i) Manually make the connection (the connection must
not be made by remote control):
(ii) Supervise the operation of the transmitter during
the connection:
(iii) Listen to each communication during the
connection AND
(iv) Stop all communications if there are operations
in violation of these (Rule 95, Subpart D)
rules
(2) Each communication during the telephone connection must
comply with all of these (FCC) rules.
(3) You must obey any restriction that the telephone company
places on the connection of a CB transmitter to a
telephone.
(b) The CB transmitter you connect to a telephone must not be shared
with any other CB station.
(c) If you connect your CB transmitter to a telephone, you must use a
phone patch device which has been registered with the FCC.

What?????????????
E field is same as axis.
E field is the polarization.
A vertical antenna is vertically polarized.
If you want horizontal polarization use a horizontal antenna.

Hello Gary: No cigar! Come on now lets see the equations and math! Lets see the energy levels for a square CM or Inch and the range equation. What is the insertion loss of cars and trucks, and what would be the levels inside the vehicles?

This is a good subject, that needs to be figured out.

Always tune for maximum MODULATED output. Disregard the dead-key.
When you've squeezed out all the peak (modulated) power you can,
then set the dead-key for your application (low for an amp or big
swing/high for no amp).

Bone stock. If you want more range, get an amplifier.

> 2. what mods should I NOT do? I hear good and bad things about
> clipping the Modulation limiters. What is your opinion?

I tried it, I put it back. If you like, you can rig up one of the lesser used switches on the front to enable/disable it. I found by running it stock you get the best allround performance.

I am a defender of a persons right to make a living, yes.

I am an defender of standing against laws that are rediculous in nature, don't REALISTICALLY hurt anyone, and make no sense.

I am a defender of the right to free speech (not for people to be able to run 100Kw to be able to carry their speech to the masses, but for someone to put up a web page to "show off" a fun sport of CB radio)

I am a defender of a persons right to knowledge, regardless of whether or not that knowledge <<could>> be used to make something illegal (inasmuch as a CB radio is concerned. I also know how to create miscellaneous explosives and backyard narcotics, but those are best left in the heads of the people who know how to do it... Dissimination of information is a touchy subject....)

I am NOT a defender of a person who maliciously attacks another, unless provoked.

I am NOT a defender of a person who "keys on" others.

I am NOT a defender of those who run splatterbox amplifiers.

Their is a lot of beliefs that we have in common, you, Joe and myself. However, I don't attempt to cram it down someones throat... I would prefer to educate someone.

If someone wants to run a 3CX3000 amplifier, let them... Educate them in the proper use, the proper way to set the station up to minimize interferience, and educate them in the proper way to construct said amplifier. That keeps them ALIVE!!

I don't believe in trolling a newsgroup looking for EVERYTHING that could POSSIBLY be construed as illegal and letting someone know about it. If they know how to turn on a CB radio and where to purchase a linear, they know it is illegal to run it.

That is their choice. They made it. It is not my job to tell them (yet again) that it is illegal. As one of the more technically minded and intelligent technicians, it IS my job to tell them how to run it correctly to keep interferience to a minimum, as well as prolong the life of their equipment!

So, that is what I do. If Bill where jamming a repeater for fun, no, I don' t agree with him. If he was jamming a repeater because someone was throwing around profane language, then yes, I think he would be justified in doing so.

So would the FCC, I believe.

Another option is with a base loaded Wilson antenna (1000 or 5000), then purchase the stinger with a coil in it.

This will bring the length down, but still provide better range than the Lil Wil.

What you describe is a digipeater not a node. A node also
does not have a mailbox. There could be mailboxes on
different stations or even BBS stations. Although you are
close enough for CB.

Wilson makes a stinger that has a load in the middle of it, and brings the 1000 down to nearly the Lil Wil dimensions.

It doesn't have quite the TX and RX distance of the full size stinger, but it does perform better than most any other antenna of comparable length.

If you want it, just request it from your local dealer. Bills2way and ExportsRUs should also be able to hook you up.

I picked this up at a thrift shop. Other than a loose connection in the microphone plug or jack (I'm not sure which, it makes the sound low volume), it seems to be either higher powered or not filtered or something. Basically I have it right next to my computer right now and when I transmit it makes the mouse move really fast in different directions. Neither of my other 2 GE radios do this. (They are supposed to put out 4 watts each, but I don't know how good they are.) It also seems to bleed over onto other channels more than the other radios I have. I'm thinking either some filter or something is completely blown or it's been "adjusted" for higher power or both? So, what do you ppl think? I will do a test tomorrow to see if you can hear it more clearly from a distance than my other car radio. (Naturally I'm not going to use it for more than a couple of seconds until I know what it's doing.)

As far as the loose connection, it makes the volume much lower unless I put pressure on the mic cord in the right up direction. I don't know if it's the jack or the mic plug. I'm not going to bother doing anything with that until I know this thing isn't shot. Plus the power meter jumps around a lot and seems to be just about useless.

Well, thanks for reading this. I hope I supplied enough information. I should put up another post tomorrow but I wanted to see what you'd say before I did the test.

Copper Electronics sucks in my opinion. I bought a 10 meter radio from them last year to the tune of about $150.00 all total with the modification book I needed just to open the radio up to the frequencies of the 10 Meter band (I assume this is legal since I hold a valid ham ticket). The radio was the biggest piece of shit I believe I have ever talked on, and I have talked on all sorts of radios in my time. Bottom line, beware of Copper and their bullshit antics, like suggesting that CBer's get on 10 meters and chat with the hams (I wouldn't recommend that you do this folks). Just one man's opinion, steer clear of Copper. I still enjoy C.B. from time to time, and I buy all my stuff from Scanner World out of New York and have never had a problem, plus the prices are reasonable.

How stupid do you think I am? I'm fully aware of the Chipswitch.
Buying and installing a chipswitch takes the cost of the radio
way above and beyond that of a 2950. In other words, a 2510 clone
with a chipswitch is not a better value than a 2950.

Pick and choose what fixes are appropriate.
In my mind the single biggest problem is that RF
is getting into the input of the voltage regulator.
This causes output voltage fluctuations that in turn
shifts the VCO which causes the audible warble.
This can be remedied by replacing and increasing
the size of the input cap.It may also help to add
other filtering components at the input and output
of the voltage regulator. Here are the files. I will
paste them to the E-mail below the asterisk line.These files
were compiled. They are not of my authoring but they should
help.
****

Are there any techs out there that could/will post the modification
that will correct the problem that the 148F GTL has when you transmit
without the engine running- anything under 13.4V and the transmit on
SSB goes all to hell. I don't have a schematic on hand for this

Well, I thought I was the only one out here that had problems too.
Sorry to see you're in the same spot I was in earlier - I found my
problem to be with their [Cobras] upgrade to the 148F. The RF Choke
or T1, is the culprit - the voltage drop across the coil is too great
- about 1.5 to 2 volts under load. The MB3756 is a voltage
regulator/switch and requires at least 11.5 volts to regulate, and

maximun of 16 - else it crowbars and can self destruct, [Believe me, I know] and the TA7222P audio chip - and everything else after it, is all handled through the RF Choke. [Up to and including Driver and Final - quite a bit of current crunchers on their own.] The original design bypassed the RF choke section and used a zener diode rated at 16-18Volts along with a electrolytic and disc cap to help filter ripple before going to the MB3756. In the newer models, the RF choke [T1] handles all the noise filtering and when put under a load, like the TX current draw, starts dropping voltage and the regulator can't regulate enough current and tops out on voice peaks during transmit, either on AM or SSB.

Also-----

The radio I have, with it's inherent faults, can be considered a lost cause. The newest problem I have found, and the purpose of the posted replies, is with the Voltage regulator itself. D44 was originally a 16-18Volt zener, now has a lower voltage rating - I believe around 15.2V in the newer ones. Many of todays cars produce around 14.4 volts to charge and run the ignition system. The MB3756 voltage reguator/switch will cut out due to a defective design, in both the component itself and the zener used on the newer models, while the engine is running [due to clamping at the diode] or distort when the engine is off [lack of voltage to regulate]. The MB3756 in these newer ones may be a defective chip, and if you have a radio that "Warbles" or "Pops" during modulation - observe the freq counter and TX/RX light - if strong, sudden vowel sounds and loud consonants type of modulation causes the TX/RX light to go green or yellow or drop frequency - suspect the regulator - it's close to crowbar'ng itself to keep regulation stable when the engine is running or dropping out when power supply voltage goes below threshold level. It's very sensitive to voltage swings.

In my situation, the load imposed was from a faulty capacitor [quite a few really] in both the input filtering, [1000uF 25V electrolytic was leaky] audio out to AM regulator [another electrolytic shorted] and due to transients, affected the MB8719 constant 8.2 volts, [three tantalums - one rated 10 volts quit during first power up on the bench.] All total sum left me with little left componentwise in the stockpile, and a piece of junk...

Also------

It is a low voltage drop out problem due to some component changes made when Cobra started using Malasian manufacturing plants.Don't even listen to all these hoky opinions of what is causing the problem-especially the dork that says it is a VCO problem. All it takes is a jumper a cut trace 1 diode and 1 capacitor and the problem is gone.

Hope this helps.

Well, lately, I've been getting a lot of mail from others regarding the 148 GTL-F model from Cobra - and this is the one that is made in Malayasia.

One of the Emails I've sent - even though this may cover more than what you want to deal with at this time - is added to this message. Please, keep this as an archive for your reference and general idea - let alone your
own good. This is a lengthy message - and is a generic response - but it covers a lot of bases you'd need to cover ground with while troubleshooting this chassis...there is a brief explanation - along with some other advice that pertains to audio problems arising from this poorly thought out chassis design.

There may be more than one type of problem - or worse, a problem that can arise later from a failure on another part of the circuit board that you may need
to fix later...the text attached - has some other key components you can offer as a list to your tech - so they can verify these parts are working like they should. PLEASE CHECK TO SEE IF THE PLL MB8719 HAS THE RCI LOGO, STAMPED ON THE CHIP - IF THIS IS THE CASE - THIS MESSAGE APPLIES TO YOU...

Reply enclosed...here is the lastest revision of my notes on this...

Date: Thursday, January 29, 1998 2:31 AM
Subject: Re: Cobra 148f warble

[...my stuff snipped...]
Yeah, it's the malaysian chassis... it has the RCI-8719-A chip which I heard is a better one than the original RCI 8719. I do, however, have an MB8719 chip (from a 1981-built 2000) sitting in the parts bin.

[Well, we might need that, after this is all over...it is the LAST resort...]

Ok, to bring you up to speed on this...

When Cobra changed from Uniden to Malaysia - they also decided to make some changes to the chassis - notably - condensing the noise from electrical power supplied - through the RF choke - for ALL of the radios power supply needs.

This poses a problem - due to excessive current draw, and the likelyhood of RF contamination in areas you don't want RF to be in - and this includes the VFO/BFO sections.

The Warble can be from excessive current draw from RF choke T1.This choke of the earlier Grant and Cobras served to filter ignition and other noises from the Audio Amplifier and Modulator circuits [The TA7222P & TR41-42 modulators.] With the rest of the RF prone areas going through the MB3756 voltage regulator/switch combination for RX/TX and PLL constant 8V regulation.

The warble is due to poor regulation from the MB3756 - it is losing power from the current draw at the filter choke - this can be fixed by splitting the power feed to the original form - and requires you to remove one trace, and install a jumper...to reduce the current demand at T1 to power everything. The MB3756 has good ripple rejection - but is flakey when voltage surges and current drops are beyond the "operating window" of 11 Volt minimum - there are 3 progammable outputs - one is left on to supply 8 volts constant that the PLL uses - with two other outputs being the TX/RX voltages.

[I would go with this first - to see if it clears up the warble - it might..just don't run the radio "flat out" if you can avoid it - for the warble is also current dependent and that means leaving in the limiter to provide some "cushion" to protect the PLL regulator portion from drawing more power than the regulator can provide.]

Install Jumper [ferrite bead of #16AWG wire would be nice - but not necessary] at J44 - by the MB3756 chip - inside chassis wall on right-side, middle - front facing you with component side up...You can also install a 0.047uF disc ceramic by this area, some boards did not come with this - mainly mine [C136]. A spot for an Electrolytic or Polarized capacitor is also located here - you may want to use a 100uF Electrolytic or 47 uF tantalum here to provide some filtering for the Regulator.

[Due to labeling - Verify that J44 does connect to the Pin 2 of the MB3756 chip.]

Also, check and verify that there is a diode in location D44 - you should have a diode similar to a 1N4148 - because of board revisions, and possible "dropped" components during soldering by machine - this component should be checked to see if it's working, and not blown open - if it has - RF contamination past the RF choke T1 can occur and problems with stability - or blown fuses - are going to happen.

D44 can be replaced with a 1N4148 with a 100PIV and a 200-300mA reverse surge rating - the diode from Cobra, in this area, is marginal in performance. Considering the cost of this component - it's a good idea to replace it now - before you find problems with it later.

The power supply feed to the RF choke that also "splits" to the MB3756 chip - is by Pin 2 on the IC4 [MB3756] - if you follow the trace side, the trace "dips" - towards the chassis wall as you follow it towards the rear of the chassis - cut clean here - to break the secondary feed from the RF choke.

[The earlier mods that I've done with this radio - have now been refined][You should check D44 - and use ferrite beaded lead on J44 for best][results...this helps keep RF from affecting the MB3756 ...
]

This completes the conversion of the feed to the original form -split only by the power switch feed and the regulator is no longer forced to accept current swings from T1 [RF choke] as it attempts to draw

current through itself and feed the Audio section and PLL regulation - they are now separate...

You may also want to check on the condition of the Electrolytics in the TA7222P area - mainly C175 and C176 - both are rated at 10 volts - you can increase to 16 volts to provide more headroom with less chance of failure. C175 is a 470uF while C176 is simply a 47uF electrolytic. And C172 should be rated 1000uF
at 28 volts. It is a good idea to check these components - mine went south after the first week of use. Another one to check in the VFO area, is C81 and C80 - both are tantalums 2.2uF/25V, and C84 - on bottom side 1000uF/10volts - all are suspect due to the warble affecting leakage around these components in a frequency sensitive area [the Balanced modulator AN612, has C95 and is rated at 10 volts 47uF - it may need replacement because of voltage swings from the "warble" being a voltage sensitive area and feed from the MB3756].

Well, did I scare you away yet - this stuff is a lot of work for one night - care for more? OK - you asked...;-) [Remember - Malaysian components were cheap and lacked quality...]

By the MB8719 - the ORIGNAL used a ferrite bead jumper known as L9 by Pin 9 of the MB8719 [we're at the PLL now...] on the 148F chassis - it's now a resistor of approx 10 ohms at 1/4 watt - I know it's silly but they did it, not me. This resistor acted as a current limiter for the [now] 5 volt tolerant PLL [RCI-8719].

Since you have the "A" PLL version, try using a lower value resistor here [L9] to 5 ohms - but use a 1/2 watt - sure it's bigger - but you do have room. This will provide current headroom without droppng voltage heavily [this is why the C89 cap was such a large value to compensate the current draw and keep voltages stable].

What I've done - and works, is to use a 1N4148 diode here - with banded end towards Pin 9 - this acts as a wattless dropper and provides the PLL with plenty of current [100PIV 200mA surge minimum] and keeps the board from "pulling" current away from the PLL during "peak" modulation times. HOWEVER, the MB8719 in mine only worked with a 5 ohm resistor and diode placed piggyback [up/down] on the board [banded side to the board on the pin 9 hole feed - with the anode tied to the resistor - with it's freed end towards the other
hole].

The clarifier mod is like the Grant/148 of older chassis - WITH ONE EXCEPTION - you use R44 in line with the voltage [8V+ to clarifier] feed to the constant 8Volt supply - this reduces current/voltage to safe levels and provides the proper drop to operate the radio within the RCI VFO recommended ranges. So, that means - remove R44 from the board, and use it in-line [soldered in parallel] with the power feed to the 8 volt constant - this may reduce slide - but keeps the MB8719 within operating range.

Ammendum
UHIC 007 [IC2] can also cause problems - since you've already replaced this component - and still have "warble" problems - the most suspected parts are the L9 region - explained above - or the T1 feed needs to be broken at IC4 [MB3756]

WARNING!
Due to numerous problems with this piece of SH*T [BCD failure -switch spiked PLL/BCD channel switch was poor quality - IC2, UHIC007 - bad, numerous bad capacitors and poor soldering joints [please check your circuit leads for solder beads and use a Geiger counter - mine was radioactive - moreso than typical background
radiation - which I found quite suprizing - the Grant that I still have is/was silent] - I've simply given up past this point - and I'll also let you know - that I no longer have this radio in my possession - it was simply a "refurb" that got past quality control - whatever that means nowadays - and is either floating down a
sewer - or is being used as a boatanchor - in it's true meaning in life...

The above was from my notes of an era long past - I hope these notes can still apply to your situation - good luck!

The HB-23 was a mobile rig. The older tube base rigs that I remember
were the "HE-20" series. They had typically, a selectable crystal
transmit (less than 23 channels) with a tuneable 23 channel receiver.

Jamming a repeater?

Look, I know you probably don't give a hill of beans for what I think here, but FWIW, anyone who deliberately jams anothers' radio hobby is the lowest of the low. There is no justifiable reason for it. If there are people on ANY radio frequency that you cannot stand, then you either move, do your best to ignore them, or you find a convienient time to discuss their personality differences off the air. If you find that you just don't "mesh" with the personalities of hams, then stick with CB. I'm sure that if the shoe were on the other foot, that you wouldn't be too happy if someone jammed all of your QSO's, simply because they didn't like your voice, or for any other reason.

We all hear our share of assholes on whatever band that we choose to run on, but if everyone decided to key up on everyone that they didn't like, there'd be nothing but hetrodyne on every frequency. I know of a few hams in my area, that I personally don't care for. One of them is a mental case, and suffers from extreme paranoia. His QSO's mainly consist of the who's-who list of people that are trying to "get" him, and the things that he's done to "prevent" it. One of our local guys felt sorry for this guy (he's far too nice), and we had to listen to this wacko drone on every night. We solved the problem by basically driving him away, by ribbing and heckling the heck out of him. He couldn't take it so he left. If we had instead resorted to simple jamming of the guy, he'd just add it to the list of things he was crusading against, and continued to drone on to whoever was lucky enough to be in QSO with him.

We all have had out share of discussions of "rules vs. no rules". Personally, I don't care if someone runs illegal power, extra channels

or whatever. But you have to be able to respect other people's right to enjoy their hobby as well. I'd much rather deal with people running 1 KW on CB, but with courtesy and respect, than a 4 watt station that swears, jams, and carries on all the time. One is breaking a technical rule, the other is breaking not only an FCC rule, but is also breaking the rules of proper social behavior.

For what it's worth.

4365. D104-M6B Modification...

Newsgroup: rec.radio.cb
Date: 1999-09-30 00:00:00 UTC
From: bgriffey@my-deja.com
Message-ID: <7svpv9j1@nnrp1.deja.com>
Source record: 4260

I have always liked the performance and tonal quality of this mic, but have always hated the extra weight and hassle of the 9V battery inside. Well, that has been rectified. I have developed a way of running the D104-M6B hand mic without the battery! My method involves using a DC source within the set to power the amplifier inside the mic. It doesn't require any additional wires(from set to mic) or any rewiring of the micropone cord. However, it does require two components and minor mods inside the set and the mic. Any interest?

How does the RF choke (for the DC ground) know which component to
drain off? The choke is essentially open at 27 Mhz. The engine noise
that the receiver would pick up would be a 27 Mhz signal, just as the
desired signal would be. I can see where the choke would drain of the
static electricity buildup on the antenna, but not an RF component

Wilson also sells a whip called the short load which is a center
loaded short whip that works with the 500, 1000, etc bases.

Go to www.wilsonantenna.com and look at their products page. Go to
the botom of the page and you'll see the "short load" whip which will
work with any of the Wilson mag mount or hard mount bases. I don't
think its meant to be used with a little Wil' though.

Hi Holly,
Well thats a good question, it depends on what you are trying to do . If you are trying to talk ground wave and want max distance then a antenna like a 102 steel wipe will do a good job. If you want an antenna that will take power and is not as long a WILSON 5000 will work fine or if you want a good antenna that has good signal to noise racial and you can hear at freeway speeds a K40 is a good choice. If you talk a lot of SSB and want range a Town & Country will do a great job. It depends what is important to you (your needs)

The warble is coming from the fact that the radio was modified
incorrectly. The DC source for the varactor diode is unstable...

I'm afraid you won't find many mods for this radio... mostly because the schematic is very hard to come by. I have never seen one. For that matter, I challenge you to give me the address of the manufacturer of this rig. I don't think you'll find it anywhere on the set, the box, or any documentation that came with that radio. Maybe they're trying to tell you something. Sorry, don't have any need for a product like that...

Make the coax long enough to go from the radio to the antenna mount.
Check the match. If the match is below 1.5:1 you are done. If not...
you can make slight variations in the match by adding small sections (2
to 3 feet) of coax to the line. Every installation is different and
there is not an exact length that can be given to you.

> Thanks, Mike

Mike,
More wattage is not a product of a swing kit. However, amplitude swinging does have its benefits. While it reduces the carrier... it raises the percentage of modulation applied to the signal. This technique is extremely valuable when using the set to drive an externel amplifier. It allows tremendous audio levels while ensuring that the amplifier will not be over-driven.

Hi Toll,
>Got the tube. Thanks.
Great, that'll teach me never to use our Royal Mail again.
>The Commander, Pride (Solid State) and Palomar 250 and 300A (Solid State)
>all had adjustable bias for each pair of devices.
Very few of these ever made it to our shores. Correct me if I'm wrong
but most all of these models go back to the 70's & 80's? Prior to
legalisation of CB here in the UK in 81 very few people imported stuff
from the US. It was mostly Euro junk as now.

I personally brought in Varmints and some Grays. On my travels around
the US back then including visiting a few CB jamborees. I had problems
tracking down sources of amp's. I managed to track down Messenger in WA,
Hurricane, Storm & Tornado in NY and if my memory serves me right Texas
Stars in NC. Other than the Messengers I never was sure if I'd found the
actual source.

Anyhow I'm into other kinds of amp's these days. Kind of gone up a step
or two if you know what I mean.
>You could really make one of those amps sing, if you knew what you where

>
>
>Your right. The higher Iq does make a difference on sideband.
>
>Now, if you would only finish that 3CX3000 mobile! we would be able to hear
>you stateside!
I've left the 3CX3000A7 with my friend John. It's in a Henry plasma
generator rack c/w 3-phase PSU.

My mobile will have to wait. Some auto dealer in MO has screwed me on my
Suburban which I'll probably now never see! That'll teach me to trust
auto dealers.

I'll consider buying another when I've put some more money by.

My present mobile is limited by space for extra alternators. A single
200A is all that's possible and this has therefor limited me to running
my 8-pill.

Remember, I also have the 3CX2500 which I may put together but a
suitable vehicle really must come first. I have no experience with
generating AC power in a mobile though I consider I have DC power
generation down to a fine art. I go about it differently than most all

you guys and have no problem holding voltage on key down.

If the two antennas overall length are comparable... then their
performance should be comparable also.

However, there is something that bothers me a bit. You say you are
using the antenna that has less engine noise. This may not be the best

choice. The reduction in noise may mean that that antenna has a lower gain than the one that picks up more noise! What really should be done is to attempt to eliminate the source of the engine noise and reduce it...

> you tried to roast me. Grab as much of the leading edge
> stuff as you can.
Will do.
> That's all useless anecdotal evidence. If you're going to
> roast me, I'm going to call you a liar to your face. You
> couldn't be more wrong by acknowledging quiescent collector
> current as the reason why your system gets good reports.
Well there is a noticeable difference between A & B when you listen to
it on air.
>
>> You may ask why the factories don't increase Icq. Because it costs more
>> dollars to build a separate high current bias source for each pair of
>> transistors and even more to produce an amp that will remain stable with
>> a high Icq. So the factories use the minimum recommended Icq because it
>> is cheaper and it yields satisfactory results.
>
> It's more than that. The amps actually work better with

> and go with it.
OK, I hear where you're coming from.
>
>> The Skywalker amp kits are probably not what you're after as they are
>> designed for 1.8-30MHz operation and are therefor not really optimised
>> for 11m.
>
> 27 MHz is in the 1.8 to 30 MHz range--isn't it?
Well yes, but, in Lee's Skywalker output transformer design he mentions
using type 43 material as against the maybe more popular type 61. The 61

material has a lower initial permeability (125), higher resistively (10p8), and higher curie temp (350c) compared to type 43 material which has values of 850, 10p5 and 130c respectively. The type 61 has a higher resistively than the type 43 which leads to higher efficiency especially on the higher freq's. He says he decided to go with the 43 due to the lower initial permeability of the type 61 material yielding a 1" long transformer with an Xl of only 11 at 1.8MHz which does not meet the requirement. A 1.5" long type 61 transformer has a Xl of 17 which does meet the requirement but the longer transformer has a much higher leakage L which hurts performance on the higher freq's. He decided, just as Helge did years ago that the best performing design over 1.8-30MHz results when the type 43 is used in a 1" long package.
He is waiting for someone to design a new ferrite material with high permeability and high resistively but is not holding his breath as materials have not changed much in years.
> You're not an idiot.
Yes, this is what my favourite school teacher used to tell me.
> Bias your amp just to the point where
> there's no audible distortion on SSB. THAT is Class B bias
> and one leading edge facet of amplifier development. Store
> this one comment as a research based golden nugget.
I will go and play in the next week or two.

Thank you.

Professor, I am surprised at you!

(Skorzy):>> I've noticed that the Wilson doesn't pick up as much of the engine noise through the antenna as the Penetrator does, which allows me to keep the squelch at a lower setting<<

(Prof):>If the two antennas overall length are comparable... then their performance should be comparable also.<

(Prof again):>However, there is something that bothers me a bit. You say you are using the antenna that has less engine noise. This may not be the best choice. The reduction in noise may mean that that antenna has a lower gain than the one that picks up more noise!<

Come on!...Do you really believe this???

(1) Relative size of antennas does NOT always mean that you can expect the same degree of gain and/or performance! Other factors such as materials used in constuction, feedline, location of mounting, method of feed (direct coax, shunt feed, etc), base, mid-shaft or top loading, type of coax & quatlity, etc. ALL variables that may affect performance!

(2) The "Penetrator" antennas have that hu-mong-ous "loading coil" that only INVITES road, engine and enviromental noise!

Anytime you expose that much of an inductor to an already noisy enviroment you are asking for even more problems. Simply moving that much surface area through free air generates static which, to an AM radio, is just more noise! More noise is NOT more gain...it's just more noise!

Example? Most of the HF antennas used by the Amateur HF mobile community are either helically-wound whips, or have the inductor inside some sort of enclosure to minimize air and other contaminates on the coil. This is not just done to extend the longevity of the antenna, it reduces noise.

Yes, there are exceptions...some antennas have loading coils that are just too big for any kind of practical enclosure on a mobile. But unless you are running HUGE amounts of power thru them, there's no need for those massive inductors.

The "Penetrator" line of antennas appeals mostly to the "Mine Is Bigger Than Yours" mindset, and has very little to do with antenna efficiency.

While I agree with your statement... that antenna length doesn't always mean the same degree of performance... it does in this instance. In this case... bigger(longer) IS better. The closer you get to the practical mobile limit of 1/4 wavelength, the better the performance and the closer you get to a unity gain station! The fact is... loaded antennas are inferior to a full length whip!!!!

P.S. Bigger coil antennas don't "invite" more engine noise! You make it sound like a noise magnet. That statement has absolutely no validity and is
ridiculous.

Hey ICE these antennas are made in a variety of lengths the shortest being somewhere around 20" plus stinger, as far as weight that is one thing I can say for sure, They are super light. I run them and prefer them, not just because they seem to work well, but because I dont like poor looking equipment and these antennas are machined from one end to the other and every machined seam hides completely when you screw them together, they look like some thing you would see on an aircraft, as far as the machine work goes. I have been running these antennas for five years without any difficulties.

The real thanks should go to Andy at codyspc@iserv.net
All i did was research Deja-News for answers to the 148
problem. I then just copied the info. His posts kept on popping
up in the search.

The 148's of recent years have had this problem on SSB.
Even the stock 148's have warbled on SSB straight out
of the box.

What i don't know is if the present day 148's have had this
problem corrected. Cobra was made aware of it long ago.
If the chain of command was not broken, and if they are
the least bit responsible, the new 148's should be fine.
Maybe someone could affirm this?

Perhaps not entirely, but if a vendor knows that a piece of equipment is generally of crap quality or performance, why sell it? Or if you do, add a note indicating that it isn't recommended. I know that these guys aren't Nordstrom's, but gee wiz, if they are going to sell a piece of crap, they OUGHT to expect it to be coming back with some regularity. Perhaps their profit margin is in the shipping charges, and they don't care if it is returned repeatedly??

Oh no! Those are evil, vile, wretched, awful bad bad men who use linear amplifiers! Shame on them! I bet their mothers brought them up by allowing them to play with linears since they were old enough to talk, first a 50 watt, then a 225 for the big 10th birthday, then the degenerate, criminal teenage years saw these people playing with amps rated at 500w PEP or more!

I just want to cry knowing that these heinous, vicious, demonic people exist!

My idea, and the reason I know it be illegal, was to have an un-maned phone patch (sort of a poor man's cell phone) so I could radio a remote device that would pick up the phone and dial out to a number of my choosing.

An earlier poster questioned the clarity of this type of communication but some of the channels are so underutilized in my area that I wouldn't have to be too concerned about clarity.

Thanks,

Greg

Do not get the PC122XL or the GrantXL unless you want a SSB radio.
What is SSB you say? Check some of the websites on this.

>Will a Wilson Little Wil antenna work okay for these radios? I am not a
>power user, and I can't see spending almost or as much for an antenna as

Unfortunately the antenna is as important as the radio. So you should
expect good ones to cost more. The Little Wil' will work for close
proximity and highway use but your not going to get to much out of it.
Its great point is that its only 36" long.

Try reducing the carrier to 2.5-3.5 and retune for output while speaking into the radio. It will be louder and be heard further down the road.

The level inside the car would vary with every vehicle and the location
of the antenna. It isn't really relevant however. The emmission is
presumably occurring in an uncontrolled environment, so the guy in the
next car, some feet away, is subject to rf exposure as well as any
passengers within the vehicle. If you somehow feel that it is possible
to lower the rf exposure within the vehicle to a safe level (by FCC
standards that is), I would love to see the numbers and how you arrived
at them. But until then, I will live with the FCC standards established
a few years ago, like them or not (my view is that they are excessively
tight, but then, I didn't conduct the study).

It is better to remain silent and thought a fool,
rather than speak and remove all doubt.
In your case it's too late. I guess you're too "stupied"
to know. Who pissed in your Wheaties this morning?

You sound like Mr. CB-King with an attitude! All your kicking and screaming,
just so you can get your blood pressure up. Maybe you'll pop sometime soon.

Ever figure that the more you cuss, the more we laugh at you. Folks don't
do anything different here than on the radio. Some folks know how the get
a good laugh at an idiot's expense. You're keeping me in stitches!

"MR.2SC2879" wrote:
>

:A>It wouldn't matter now would it? The radio would be illegal even for a Hamster
:A>to have.

BZZT!

A licensed ham can have whatever radio they want. If you were a licensed
ham it would be perfectly legal to use this radio, as long as you used
it on the legal frequencies. Many ham rigs actually RX and TX from
.5 Mhz all the way through 30Mhz, without any interruption. It is legal
to own these rigs, as long as you don't use them illegally.

Hello All

Here is One for You to kick around.
I have a Cobra 148GTLDX, the old Model. After having a Freq. Counter hooked up and in the shop twice
to have this Warble Fixed, I am told that it is still there.
My Question is what causes it and how to get rid of it ? The Radio seems to be Driving My TS DX400 well.
On SSB it swings to the end of the 500w Scale and needs more Meter.
Anyway.................

This Warble is Driving Me Crazy, Please Help !!
TIA

Mike

4444. F/S Dominator Amp

Hi

A friend has just given me a pair of fairly old but working US frequency walkie-talkies

They are Realistic Model TRC-200

They are fitted with replaceable transmit & receive crystals.

My question is: can I fit crystals to get these working within the UK permitted CB wavebands and if so, what crystals ?

Many Thanks, please suggest other newsgroups if you think this one is inappropriate

4447. Hi

Jamming isn't all there is to it just like having the
highest output amp in a particular class isn't all
there is to a competition.

Do anyone know about any mods for this radio?
or maybe a good website?
